INTRODUCTION

INTRODUCTION

In accordance with our Proposal to the Dormitory Authority State of New York, authorized on October 18, 2010, we submit this Feasibility Study encompassing two dining halls, Pathfinder and Littlepage Halls, and associated connecting tunnels, retaining walls and exterior stairs. This study examines the condition of the exterior walls, roofs, fenestration, associated mechanical, plumbing and electrical, and extent of related asbestos abatement, and recommends the extent and type of repair and/or replacement of components in a cost effective manner, optimizing the life of each system.

Woolley Morris Architects, the prime consultant for the report's preparation, focused on the fenestration systems and project coordination. Klepper, Hahn & Hyatt provided façade and roof services, C&S Companies provided MEP services, and Ravi Engineering assisted with asbestos inspection, sampling, and asbestos cost estimating. All observations and recommendations are included in this study.

The extent of the report is limited to those specific systems as identified for analysis by SUNY Oswego as outlined above. In addition, the following areas are specifically noted as outside the limits of the report's investigation, and include:

- Analysis of life safety systems and potential violations thereof.
- Any requirements for OSHA compliance for employee roof access, including guardrails, tie offs for fall protection devices, ladders and safety cages, etc.
- Design and construction administration services relating to the design of repairs or development of schemes to address the conditions observed in this study.

If any of these systems have not been assessed by the Campus recently, their need should be determined, and then the in-place conditions should be reviewed, assessed, and any deficiencies addressed.

REVIEW CRITERIA

REVIEW CRITERIA

EXTENT OF OBSERVATIONS, SITE ANALYSIS, AND REVIEW OF DOCUMENTS:

ROOF:

Klepper, Hahn & Hyatt spent several days onsite performing limited visual review of the buildings' roofs. A roofer was engaged to perform test cuts and repairs on the buildings' roofs.

The campus provided Klepper, Hahn & Hyatt with copies of design drawings of both buildings, which were reviewed for information relative to the roofing assessment and structural information for snowdrift loading analyses.

FAÇADE:

Klepper, Hahn & Hyatt spent multiple days onsite performing limited visual review and hammer sounding of nearly 100% of the building façades from the ground, roofs and from a 50' scissors lift.

The purpose of the Façade Condition Review section is to perform a limited observation of the façade elements, and to develop a professional opinion of the cause of any distress, damage, and deterioration observed. This report includes a description of observations, descriptions of mechanisms that are believed to be the cause oh the observed distress, damage, and deterioration, as well as recommendations for remedial work.

This review was limited to the visual described here in only. Klepper, Hahn & Hyatt did no physical testing of structural elements, or mathematical structural analysis of the elements' capacities. Site observations of the existing conditions were not exhaustive, and there have been some significant conditions which were not visible.

Klepper, Hahn & Hyatt was not made aware of, nor encountered to their knowledge, the presence of any hazardous or toxic materials. These materials include, but are not limited to, asbestos, combustible materials and gases, PCB's, radioactive materials, and hazardous waste.

The campus provided Klepper, Hahn & Hyatt with copies of design drawings of the buildings, which we rereviewed for the limited purpose of the detailing of the facade and the structure's possible effect on the performance of the facade.

WINDOWS:

Woolley Morris Architects spent several days on site performing close range visual inspections of the window systems, entrance storefronts and exterior doors of both dining halls and adjacent tunnels, with the aid of a 50' scissors lift. Available drawings, representing original construction and subsequent renovation scopes, were also analyzed.

Information derived during investigative demolition of windows at Onondaga, Oneida and Cayuga Halls during previous renovation projects helped to ascertain whether typical windows can be replaced without impacting interior finishes and convectors at the buildings covered under the present study.

ASBESTOS AND PCB:

Non-analytical documentation of past asbestos sampling conducted within the dining halls was reviewed prior to the inspection. In addition, as-built record drawings were also reviewed prior to the inspection. Window sections from these drawings indicate an asbestos cement backer board on the bottom window panels within the two tunnels attached to each of the two dining halls, and vinyl asbestos floor tile. Suspect asbestos and PCB containing materials not previously identified or sampled which have the potential to be impacted by this

study were sampled and analyzed for asbestos and PCB content determination. The AHERA and DASNY sampling protocol (for asbestos) were not utilized for the feasibility study. Areas of inspection were limited to potential areas of impact with regards to the feasible options of the window, façade and roof renovations. Roof materials have been sampled and the results indicate the presence of ACM.

CODE REFERENCES:

ROOF:

- 2010 Existing Building Code of New York State

Campus specific presents wind uplift design values (Figure 1608.2 of NYS Building Code) :

Building	Design Snow Loads, psf	Roof Load
All	55 psf = P_G	42.4 psf = P_F

Importance factor, wind – I_W 1.15
Importance factor, snow – I_S 1.10

Since all of the subject buildings were built before 1980, the roof structures should be evaluated for load capacity prior to any reroofing project where the roof insulation will be increased, or the vapor retarder will accumulate much less snow and ice loading over the course of a winter season than a well insulated roof. Prior to the mid-1970's, the NYS code did not require roofs to be designed to support drifting snow.

Design Uplift, Highest Main Area

Building	Main	Perimeter	Corner
Pathfinder	45		
Littlepage	45		

Design "R' Values all roofs, thermal insulation, based on Table 802.2(5), Energy Code, concrete decks, climate zone 14a, 25% to 40% glass wall coverage. The actual values given below are exclusive of deck, ceilings, if any, and interior air film values – added "R" values can be expected, generally, from 5% to 10%. Isocyanurate insulation is calculated at a conservative 5.88 per inch (C-0.17).

Building	Design New	Actual Calculated
Pathfinder	"R" = 23	"R" = Unknown
Littlepage	"R" = 23	"R" = Unknown

Seismic Review: The 2010 Existing Building Code of New York State, Section 506 Structural 506.1 General applies only to buildings built after January 1, 2006.

There are no unreinforced masonry parapets on the buildings in this project.

FAÇADE:

- 2010 Existing Building Code of New York State – Section 402 Repairs and Chapter 5 Repairs.

Review Criteria:

1. Observation and hammer sounding of cast in place concrete façade elements.

2. Inspection and documentation of deteriorated elements including sealant joints, exposed aggregate pre-cast concrete façade panels, exterior attachments of electrical conduit, lights, vent stacks, rails, plumbing fixtures, etc.

3. Observation and hammer sounding of cast in place concrete retaining walls, concrete railing elements and link tunnel concrete façade elements for concrete delaminating and spalling that require repair.

Evidence of mechanisms occurring which accelerate the deterioration of the façade or other systems.

WINDOWS AND DOORS:

- 2010 Existing Building Code of New York State – Section 403 Alteration – Level 1 and Chapter 6 Alterations – Level 1.

- 2010 Energy Conservation Construction Code of New York State – Section 101.

Section 602 Building Elements and Materials, Paragraph 602.3 Materials and Methods states that all new work shall comply with materials and methods requirements of the 2010 Building Code of New York State that specify material standards, detail of installation and connection, joints, penetrations, and continuity of any element, component, or system in the building.

Section 604 Means of Egress, Paragraph 604.1 General states that repairs shall be done in a manner that maintains the level of protection provided for the means of egress.

Section 605 Accessibility, Paragraph 605,1 states that a building, facility or element that is altered shall comply with the applicable provisions in Sections 605.1.1 through 605.1.12 of the Existing Building Code of New York State, Chapter 11 of the Building Code of New York State and ICC/ANSI A117.1 unless it technically infeasible. Where compliance with this section is technically infeasible, the alteration shall provide access to the maximum extent that is technically feasible.

ASBESTOS:

Asbestos related work shall be performed in accordance with New York State Industrial Code Rule 56, 40 CFR 61 and 29 CFR 1926. Contractors who disturb asbestos containing materials must maintain a current license pursuant to New York State Department of Labor and Department of Environmental Conservation. All asbestos related work must be completed by workers who have a valid NYS asbestos handling or supervisor certificate pursuant to Industrial Code Rule 56.

PCB containing materials shall be removed, handled and disposed of in accordance with current Federal, State and Local requirements. Contract specifications should be developed and included within Contract Documents when this project progresses to the point to do so.

MECHANICAL, ELECTRICAL, PLUMBING:

Existing devices will be removed and installed to account for the installation/replacement of the window and door assemblies. All work shall be performed in accordance to the following codes:

- 2010 Mechanical Code of New York State.

- 2010 Plumbing Code of New York State

- 2008 National Electrical Code NFPA 70.

- 2010 Existing Building Code of New York State.

PATHFINDER HALL

PATHFINDER HALL

BUILDING DESCRIPTION:

Pathfinder Hall is a cast-in-place concrete framed building of two stories, built from drawings dated 1965. The building is square in plan with 127'-4" sides, giving it a footprint of 16,200 square feet. The façade consists of exposed cast-in-place concrete columns, and spandrel beams that extend out proud of the plane of the façade. The bays formed by the concrete beams and columns are in-filled with glass curtain wall on the south elevation and the central half of the east and west elevations. Exposed aggregate precast concrete wall panels fill out the ends of the east and west elevations and all of the north elevation. Window and entrance door systems are composed of narrow profile bronze anodized aluminum curtain wall framing, single pane glazing at upper sash, spandrel glazing at lower sash, and matching entrance storefront systems.

Both floors of the building are above grade on the south elevation and two thirds of the east and west elevations. Enclosed tunnels extend from the lower level to adjacent dormitory buildings from both the east and west. The tunnels are cast in place concrete with the south façades exposed concrete with punched window openings. The tunnel structures function as retaining walls allowing the grade to step up leaving only the top floor above grade at the north elevation, the higher grade continues around on the east and west elevations over the tunnels. The link tunnels are covered in detail in the "Connecting Tunnels & Retaining Walls" section of this Feasibility Study.

A loading dock is centrally located on the north elevation. Two low retaining walls extending north from the northeast and northwest corners of the building border a paved parking/loading dock access lot that slopes toward the building.

The University Police Department occupies most of the lower level with the entrance centrally located on the south side of the building.

ROOF:

Number of stories: 2.

The building roof is flat, essentially square, with an area of 16,000 square feet. (See Photo R-31-01).

A one story centrally located penthouse is above the main roof. The penthouse is rectangular measuring 19'-4" north-south and 38'-6" in the east-west axes.

Dining Hall kitchen ventilation duct work occupies a space north of the penthouse. (See Photo R-31-01).

The roof perimeter is terminated on the top of a low cast in place concrete parapet capped with a metal gravel stop flashing. The EPDM membrane extends up the interior face, over the top of the low parapet and terminates at the top outer edge of the gravel stop flashing. (See Photo R-31-02).

On the south side of the building there is an entrance canopy roof over the first floor entrance doors, constructed in 2000 when the lower level was renovated for the UPD occupancy. (See Photo R-31-03).

- **System Description**

The roof is comprised of a black single ply EPDM membrane adhered to a tapered polyisocyanurate rigid insulation board system hot mopped to a vapor retarder to the concrete deck. Four roof drains are centrally located.

The roof membrane extends up the interior face of the low concrete parapet, across the top, and terminates on a metal gravel stop flashing bent over the outside face extending down the outside face about 4 inches.

A lightening protection system is situated around the perimeter of the main roof and the penthouse roof.

The penthouse roof is flat with a 2" raised roof edge. The roof membrane appears to be of the same material as the main roof. Drainage is via one roof drain centrally located along the east edge.

PATHFINDER HALL

- **Observations**

Multiple membrane laps seam laps are de-bonding along the field and perimeter of the roof. (See Photo R-31-04).

Multiple patches and evidence of previous repairs were observed. Building staff indicated that interior leaks have been reported.

Drains were generally clear with adjacent tapered insulation crickets providing some drainage; however, large areas of water ponding was evident below mechanical equipment. One of the roof drains was missing a strainer cover. (See Photo R-31-05).

Walkway pads are missing and others are freely blowing in the wind.

Parapet membrane flashings around the roof perimeter are in poor condition, and have failed in numerous locations.

Lack of positive membrane adhesion to the insulation boards is evident. During the inspection, membrane flutter was observed over several large areas.

The taper substrate is questionable at multiple locations under foot, suggesting that the insulation boards have been exposed and/or are wet. The membrane lacks a positive bond to the insulation board in multiple locations and was observed fluttering during the inspection.

The metal top and sides of the large metal ventilation duct plenum on the roof are heavily rusted. (See Photo R-31-06).

Base flashing around the perimeter of all roof penetrations are showing signs of deterioration.

Test cuts indicate that the roof assembly is wet and has been exposed to water previously. Typical roof assembly consists of:

- 60 mil EPDM membrane adhered to,
- Polyisocyanurate taper board hot mopped to,
- 3 ½" Polyisocyanurate board, hot mopped to,
- 3 ply vapor retarder hot mopped to,
- concrete deck.

- **Conclusions**

The lack of membrane bond and extensive wind fluttering is a concern. Numerous nail holes, rips and tears in the membrane are possible sources of water entry. Perimeter terminations need to be replaced. Large areas of ponding indicate poor drainage and remain a risk for water entry.

- **Recommendations**

It is recommended that membrane and roof assembly be removed to the vapor retarder and replaced. Replace existing roof drain strainers with lockable type or cast iron to reduce the risk of blow off. Replace walkway pads with fully bonded pads and add walk pads below equipment and wiring currently draped across the membrane surface.

We recommend the following temporary measures be taken as soon as possible to improve the likelihood of the roof remaining serviceable until it can be replaced.

- Provide and install ballast in the form of a 2' by 2" concrete pavers over the areas of debonded membrane.

- Closely inspect the roof, particularly the parapet membrane flashings around the roof perimeter, and repair and reinforce existing tears, nail punctures, tents, splits, and seams judged to be inadequate.

We recommend careful inspections of the roof every three or four months until the roof can be replaced.

Roof plan drawing, inspection cut locations:

Reference Photos: R-31-2A, 01 through 06

FAÇADE:

- **System Description**

The façade consists of exposed cast-in-place concrete columns, and spandrel beams that extend out proud of the plane of the façade. The bays formed by the concrete beams and columns are in-filled with glass curtain wall on the south elevation and the central half of the east and west elevations. Exposed aggregate precast concrete wall panels fill out the ends of the east and west elevations and all of the north elevation.

- **Observations**

General: Many of the observations for this building are similar to those documented in the Littlepage Dining Hall report.

There are numerous locations on the concrete façade elements where areas of the concrete surface have spalled, broken, cracked, or deteriorated. These areas can be categorized as follows:

- Small spalls at rusted reinforcing bars - frequently beam stirrups. (See Photo F-31-01).
- Surface deterioration of rubbed and parged surfaces. (See Photo F-31-02).
- The top surfaces of concrete façade elements have considerable mosey and liken vegetative growth. (See Photo F-31-03).

The rustication strips in the soffits of the spandrel beams which are transverse to the beam span, that is, perpendicular to the building façade, allow water to run from the face of the spandrel to the surface of the window wall. This is evidenced by staining of the spandrel soffit and the intersecting area of the window wall.

Many of the sealant joints around the window wall areas and exposed aggregate panels are deteriorated. Deterioration includes gaps, adhesive failure, cohesive failure.

Some of the shallow rustication strips in the concrete façade elements have been filled with elastomeric sealant.

None of the exposed aggregate panels were in a condition that required remediation. On approximately 10 percent of the panels there was rust staining. This is likely due to the presence of discrete iron-rich aggregates.

Vertical movement joint between the Tunnel connecting link from the east side of Pathfinder and Seneca Hall is open. The cap flashing on the top appears to have been installed as an interim solution to an apparent water leak. (See Photo F-31-04).

A canopy roof and a concrete site wall were relatively recently added to the south entrance of the building, adorning the University Police headquarters. Both elements are in good condition. (See Photo F-31-05).

- **Conclusions**

The building's original construction had imperfections, which have led to deterioration. These imperfections include:

- Areas of inadequate concrete cover over reinforcing bars
- Over-rubbed surfaces, and excessive parging

The transverse rustication strip at the midspan of the spandrel beam soffits deliver precipitation to the beam

soffit and to the window wall, erasing the benefit of the lateral drip edge rustication strip. This leads to staining, acceleration of beam soffit deterioration, and amplifies any window or sealant condition which could cause leakage.

The parapet has a cold construction joint running horizontally through it, at the roof slab elevation. This has apparently been a location of flexure and/or moisture mitigation that has resulted in a line of cracking and distress.

Nearly forty years of exposure to environmental conditions has deteriorated the surfaces of the cast-in-place concrete façade elements. They are absorbing precipitation and condensation moisture at an increasing rate over time.

The building has experienced a multitude of sealant campaigns, presumably to address water intrusion issues. Some of this work has been done without complete removal of the previous sealant, some of the work has adhesive failure, some sealant was improperly or excessively installed, and some sealant has been installed where none is required or should be, such as in the rustication joints and possibly covering window weeps.

The loading dock on the north side of the building is exhibiting deterioration due to environmental exposure, presumably including the application of deicing chemicals.

- **Recommendations**

Patch deteriorated, spalled, and missing sections of cast-in-place concrete façade. This should be done to mitigate the ongoing deterioration of the distressed areas. (Estimate 200 sf.) Saw cut adjacent to exposed steel reinforcing with inadequate concrete cover, remove concrete behind the steel reinforcing allowing it to be pounded in below the surface providing space for additional concrete cover over the existing steel reinforcing.

Fill the portion of the transverse spandrel soffit rustication strips from the existing drip channel to the face of the building with concrete repair mortar, in order to mitigate the travel of rainwater running in to the face of the wall and window walls. (Estimate 40 locations.)

Prepare and coat all exposed cast-in-place concrete façade surfaces. This should be done to mitigate the ongoing deterioration of the distressed areas. (Estimate 8000 sf.)

Remove and replace all sealant joints in the façade which require sealant - not the joints that should not be sealed. (Estimate 650 lf.)

The removal and replacement of sealant joints and backer rod material around the windows is covered in the Windows section of this Report.

Prepare, prime and paint all expose steel on the building exterior including, hand rails, steel angles at the loading dock, pipes, bollards, roof top HVAC units, conduit, grills, stairs, etc.

Apply urethane traffic membrane coating to the top surface of the loading dock.

Reference Drawings: Facade drawings: F-31-1A and F-31-1B

Reference Photos: F-31-2A, 01 through 05

WINDOWS AND DOORS:

- **System Description**

The original window system construction at both upper and lower levels consisted of 7-1/2" deep aluminum curtain wall framing with single pane glazing and matching narrow profile entrance doors. Sill framing was 7-

1/2" high, while intermediate mullions, head and jamb members were 2-1/2" wide framing. With the exception of the entrance storefront framing, sill, mullion, jamb and head framing members incorporated structural steel reinforcing. Finishes throughout were bronze anodized aluminum.

Upper level dining hall windows featured floor-to-ceiling fixed glass, with large upper vision glazing over lower spandrel glazing backed with rigid insulation and a reinforced porcelain enamel panel interior finish. Lower level office / lounge windows featured full height fixed vision glazing with an integral plastic laminated steel crash bar. (See Photo W-31-01).

The rear (north) loading door featured a pair of swinging hollow metal doors surmounted by painted metal insulated panels. Two fixed louvers with matching bronze anodized aluminum finish were installed in the west and east supporting walls of the loading dock.

Upper level curtain wall systems remain as originally installed, with the exception of entrance storefronts, which have been replaced in their entirety with a slightly modified framing layout, insulated sash, and a bronze anodized aluminum finish darker than the original units. (See Photo W-31-02).

Lower level curtain wall systems have experienced more significant replacement, particularly as a result of a 2000 renovation during which the University Police Department was relocated to this level. As at the upper floor, entrance storefronts at the east and west elevations were replaced in their entirety with a slightly modified framing layout, insulated sash, and a bronze anodized aluminum finish darker than the original units. In addition, modifications at the east, south and west elevations resulted in the selective replacement of original full-height glazing bays with aluminum sliders over opaque aluminum panels and, in one bay, a new glazed aluminum exit door. In general, these replacement units feature the slightly darker bronze anodized aluminum finish. (See Photo W-31-01). However, the central south bay replacements, at the main entrance to UPD, feature a dissimilar blue aluminum finish. In order to achieve a coordinated appearance on the interior, original aluminum framing members were wrapped in aluminum break metal of the matching blue finish. (See Photo W-31-04).

- **Observations**

Original curtain wall units, due to single glazed sash and lack of thermal breaks in framing available at the time of construction, are inherently energy inefficient. Anecdotal evidence from SUNY Oswego attests to the drafty characteristics of these units; further, wind-driven rain can penetrate the sealant locations to interior finishes.

Despite some fade and color variation between panel and frame, the original duranodic finish on the aluminum, now almost forty-five years old, has held up remarkably well, preserving unit integrity.

Analysis of original construction details raises some questions as to the integral connection of the curtain wall unit and adjacent interior wall finishes, and whether curtain wall units can be replaced without impacting interior finishes and attached heating convectors. (See Photos W-31-05 and W-31-06). In addition, previous investigation revealed the absence of cavity wall insulation, blocking, and closed cell backer rod behind perimeter sealants.

Perimeter sealants between window frame and adjacent aggregate wall panels have failed typically, despite successive applications, as noted in Façade Observations.

Removal of existing curtain wall systems and related sealants, and the design of replacement systems, will need to be coordinated closely with asbestos abatement procedures, based on results of asbestos sampling and analysis (Refer to Asbestos Abatement section).

- **Conclusions**

Pathfinder and Littlepage Dining Halls are part of a six-building complex (four residence halls and two dining halls), designed and construction of similar scale, materials and colors, and intended to read as a single large composition. Constructed from the late 1960's to early 1970's, they currently fall outside the time period triggering review by the State Historic Preservation Office (SHPO). However, given the overall scale and integrity of the building complex and the importance that fenestration plays in defining the character of these buildings, fenestration replacement should maintain or redefine a consistent imagery throughout the complex.

Original curtain wall units, while maintaining sash and frame finish integrity, provide substandard thermal performance due to single glazed sash, absence of thermal breaks in framing members and poorly insulated

wall cavities. These should be replaced with aluminum framed, insulated sash units capable of providing thermal performance that meets or exceeds current energy code requirements.

Investigative demolition undertaken at Onondaga, Oneida and Cayuga Halls during previous window replacement projects (representative of similar construction methods throughout West Campus dorms) revealed the likelihood that window replacement can be undertaken with minimal additional impact to interior finishes and attached heating convectors. However, since interior finishes were usually applied up to the curtain wall framing, compatible aluminum trim components may be required to be designed and detailed.

Based on previous west campus fenestration replacement projects undertaken, replacement of curtain wall systems will afford an opportunity to address original construction problems such as inadequate cavity wall insulation and sealant application.

An analysis of the performance of some previous window replacement units throughout the campus, and the effects of the inherently severe weather conditions, dictate curtain wall replacement systems offering superior performance requirements and finishes. In addition, curtain wall replacements should be carefully designed so as to provide optimum attachment, and sized to correctly apply perimeter sealants and back-up materials. A sealant system should be designed and installed that anticipates the need to periodically remove and reinstall subsequent applications while not jeopardizing system integrity.

- **Recommendations**

Remove all existing curtain wall and door systems, including exterior and interior entrance storefront units. Provide temporary protection as necessary. (Refer to Asbestos Abatement Section.)

Remove all previous perimeter sealant applications. (Refer to Asbestos Abatement Section.)

Provide cavity wall insulation as necessary following exposure of wall interior construction.

Install new high-performance aluminum-framed curtain wall systems with fluoropolymer finish (AAMA 2605), narrow profile frames, insulated sash and compatible spandrel panels. Per campus directive, investigate the use of selective operable sash to provide natural ventilation to main dining hall, utilizing narrow profile operable sash framing within curtain wall framing in order to minimize sash frame profiles.

Install new aluminum-framed entrance storefronts at exterior and interior entry vestibules with insulated sash, medium stile door profiles and matching fluoropolymer finish.

Replace rear loading door, matching existing type, with painted finish to match proposed curtain wall framing finish. Existing metal panels above shall remain, painted to match proposed curtain wall framing finish.

Replace all louvers with new fixed units, painted to match proposed curtain wall framing finish.

Provide polyurethane foam joint filler and new sealant system throughout.

At the previous West Campus dorm fenestration replacement projects, the campus recommended that the entrance storefront systems be replaced with a dark green finish. Since the entrance storefronts at the dining hall are asymmetrically placed on the building elevations (unlike adjacent residence halls, where they are centered), it is recommended that their finish match that of adjacent curtain wall replacement systems.

Provide new interior window treatments to match existing throughout.

Reference Photos: W-31-3A, 1 through 5

PATHFINDER HALL

ASBESTOS AND PCBs

- **System Description**

The window, roof and façade scopes will impact asbestos and PCB containing materials.

- **Observations**

The upper windows on the west end of the south elevation have a caulk on the far left and right side of the five window unit, full height. This caulk was inaccessible for sampling and is therefore assumed to be asbestos and PCB containing.

The roof is an EPDM system. Suspect asbestos-containing materials were sampled and the results are outlined below.

- **Conclusions/Recommendations**

A reputable contractor in accordance with New York State Industrial Code Rule 56, and all applicable codes, rules and regulations must abate asbestos containing materials impacted by the scopes of this study.

Removal of PCB containing caulk generates a regulated hazardous waste. PCB containing materials shall be removed, handled and disposed of in accordance with current Federal, State and Local requirements. Contract specifications should be developed and included within Contract Documents when this project progresses to the point to do so.

Windows:

It is recommended that the center upper window unit (7 windows in unit), west elevation, be removed by the abatement contractor and disposed of as asbestos containing, due to the presence of asbestos containing caulk located along the bottom and half way up the far left and right side of the unit.
It is recommended that the upper windows on the west end of the building, south elevation, be removed by the abatement contractor and disposed of as asbestos containing, due to the presence of assumed asbestos containing window caulk located on the far left and right side of the unit, full height.

Roof:

It has been determined by laboratory analysis that the curb/penetration flashing cement associated with the roof mounted mechanical equipment and ductwork is asbestos containing. It is recommended that the abatement contractor remove the asbestos-containing roof curb/penetration flashing cement in its entirety and dispose of as asbestos containing material if this material will be impacted by planned renovations.

MECHANICAL, ELECTRICAL, PLUMBING:

- **System Description**

The heating system has a radiant fin tubing feed from the existing boiler system. The fin tubing is located along the wall assembly below the windows.

- **Observations**

The radiant heat tubing runs along the entire wall assembly. In some locations, the interior wall shows signs of damage. Wall heating assembly is wall mounted.

PATHFINDER HALL

Electrical outlets were found located below the existing fin tubing assembly. The outlets are fed from a riser in the wall column, and are then surface-mounted around the room.

- **Conclusions**

The existing heating system will need to be removed and reinstalled to avoid damage, and simplify the replacement of the curtain wall assemblies.
The existing wall outlets will need to be removed and reinstalled. All existing raceway may be reused.

- **Recommendations**

Replace with existing fin tubing enclosures to match.

LITTLEPAGE HALL

LITTLEPAGE HALL

BUILDING DESCRIPTION:

Littlepage Hall is a cast-in-place concrete framed building of two stories, built from drawings dated 1966. The building is square in plan with 127'-4" sides, giving it a footprint of 16,200 square feet. The façade consists of exposed cast-in-place concrete columns, and spandrel beams that extend out proud of the plane of the façade. The bays formed by the concrete beams and columns are in-filled with glass curtain walls on the south elevation and the central half of the east and west elevations. Exposed aggregate precast concrete wall panels fill out the ends of the east and west elevations and all of the north elevation. Window and entrance door systems are composed of narrow profile bronze anodized aluminum curtain wall framing, single pane glazing at upper sash, spandrel glazing at lower sash, and matching entrance storefront systems.

Both floors of the building are above grade on the south elevation and two thirds of the east and west elevations. Enclosed tunnels extend from the lower level to adjacent dormitory buildings from west ends of both the north and south elevations. The tunnels are cast in place concrete with the south façades exposed concrete with punched window openings. The tunnel structures function as retaining walls allowing the grade to step up leaving only the top floor above grade at the north elevation, the higher grade continues around on the east and west elevations over the tunnels. The link tunnels are covered in detail in the "Connecting Tunnels & Retaining Walls" section of this Feasibility Study.

A loading dock is centrally located on the west elevation. Two low retaining walls extending west from the northwest and southwest corners of the building border a paved parking/loading dock access lot that slopes toward the building.

ROOF:

Number of stories: 2.

The building roof is flat, essentially square with an area of 16,000 square feet. Access to the roof is through a 30" square roof hatch.

A one story centrally located penthouse is above the main roof. The penthouse is rectangular, measuring 19'-4" east-west and 38'-6" in the north-south axes. (See Photo R-35-01).

Dining Hall kitchen ventilation duct work occupies a space north of the penthouse. (See Photo R-35-02).

The roof perimeter is terminated on the top of a low cast in place concrete parapet capped with a metal gravel stop flashing. The EPDM membrane extends up the interior face, over the top of the low parapet and terminates at the top outer edge of the gravel stop flashing. (See Photo R-35-03).

- **System Description**

The roof is comprised of a black single ply EPDM membrane adhered to a tapered polyisocyanurate rigid insulation board system hot mopped to a vapor retarder to the concrete deck. Four roof drains are centrally located.

The roof membrane extends up the interior face of the low concrete parapet, across the top and terminates on a metal drip edge flashing over the outside face extending down the outside face about 4 inches.

A lightening protection system is situated around the perimeter of the main roof and the penthouse roof.

The penthouse roof is flat with a 2" raised roof edge. The roof membrane appears to be of the same material as the main roof. Drainage is via one roof drain centrally located along the north edge.

- **Observations**

Many membrane seam laps are debonded along their edges. (See Photos R-35-04 and R-35-05).

LITTLEPAGE HALL

The metal top and sides of the large metal ventilation duct plenum on the roof are heavily rusted.

Base flashing around the perimeter of all roof penetrations are showing signs of deterioration.

Some walkway pads appear to be missing.

Parapet membrane flashings around the roof perimeter are in poor condition, and show signs of possible failure.

Test cuts indicate that the roof assembly is dry and in good condition. The typical roof assembly consists of:

- 60 mil EPDM membrane adhered to,
- Polyisocyanurate taper board hot mopped to,
- 3 ½" Polyisocyanurate board, hot mopped to,
- 3 ply vapor retarder hot mopped to,
- concrete deck.

- **Conclusions**

Generally, the roof appears to be in fair condition but needs ordinary repairs of the seam laps and perimeter flashings. All building components require maintenance and repairs; this existing roof is no exception. Additional membrane life can be expected from this roof with proper maintenance and repairs.

- **Recommendations**

Replace all perimeter parapet wall flashings and edge metals. Inspect and re-seam membrane lap joints with a compatible repair material. Replace existing roof drain strainers with lockable type or cast iron to reduce the risk of blow off. Replace walkway pads with fully bonded pads and add below equipment and wiring. Repair penetration flashings as needed. Recommend twice annual inspections.

Roof plan drawing: R-35-1A
Roof plan drawing, drainage spacing:
Roof plan drawing, inspection cut locations:

Reference Photos: R-35-2A, 01 through 05

FAÇADES:

- **System Description**

The façade consists of exposed cast-in-place concrete columns, and spandrel beams that extend out proud of the plane of the façade. The bays formed by the concrete beams and columns are in-filled with glass curtain walls on the west elevation and the central half of the north and south elevations. Exposed aggregate precast concrete wall panels fill out the ends of the north and south elevations and all of the east elevation.

- **Observations**

General: Many of the observations for this building are similar to those documented in the Pathfinder Dining Hall report.

There are numerous locations on the concrete façade elements where areas of the concrete surface have spalled, broken, cracked, or deteriorated. These areas can be categorized as follows:

- Small spalls at rusted reinforcing bars - frequently beam stirrups. (See Photo F-35-01).
- There are a number of areas where the cast-in-place concrete façade surfaces have been extensively rubbed, or parged, during the original construction. Much of the surfaces have thin hairline cracking or other evidence of superficial distress. (See Photo F-35-02).

- The top surfaces of concrete façade elements have considerable mosey and liken vegetative growth.

The rustication strips in the soffits of the spandrel beams which are transverse to the beam span, that is, perpendicular to the building façade, allow water to run from the face of the spandrel to the surface of the window wall. This is evidenced by staining of the spandrel soffit and the intersecting area of the window wall. (See Photo F-35-03).

Many of the sealant joints around window walls, exposed aggregate panels, and adjacent on grade concrete are deteriorated. Deterioration includes gaps, adhesive failure, cohesive failure and improper recoating of existing sealants without proper preparation.

Exposed aggregate panels are generally in good condition. On approximately 10 percent of the panels there was rust staining. This is likely due to the presence of discrete iron-rich aggregates. (See Photo F-35-03).

The concrete entrance walk at the base of the ramp on the south side upper level has settled where it abuts the concrete ramp leaving a one inch or better lip that presents a trip hazard. (See Photo F-35-04).

At grade along the west elevation, the concrete splash strip has settled and cracked and now slopes toward the building. (See Photos F-35-05 and F-35-06).

Loading dock stairs originally had a side light flush mounted in a recess cast into the concrete wall. The fixture box has completely corroded. (See Photo F-35-07).

There is general concrete deterioration at the loading dock. A large vent grill in the north end of the loading dock would seem to support the belief that there is open space below some or all of the loading dock. (See Photo F-35-08).

A gray coating or paint has been applied to the lower half of three concrete columns on the north half of the east elevation. The same coating was applied to the exposed foundation wall below the horizontal spandrel beam. (See Photo F-35-09).

Vertical joints between the Link tunnels and Littlepage are at the end of their service life. The cap flashing on the top appears to have been installed as an interim solution to an apparent water leak.

- **Conclusions**

The building's original construction had imperfections, which have led to deterioration. These imperfections include:

- Areas of inadequate concrete cover over reinforcing bars
- Over-rubbed surfaces, and excessive parging

The transverse rustication strip at the midspan of the spandrel beam soffits deliver precipitation to the beam soffit and to the window wall or building facade, erasing the benefit of the lateral drip edge rustication strip. This leads to staining, acceleration of beam soffit deterioration, and amplifies any window or sealant condition which could cause leakage.

Nearly 44 years of exposure to increasing detrimental environmental conditions has deteriorated the surfaces of the cast-in-place concrete façade elements. They are absorbing precipitation and condensation moisture at an increasing rate over time.

The building has experienced a multitude of sealant campaigns, presumably to address water intrusion issues. Some of this work has been done without complete removal of the previous sealant, some of the work has adhesive failure, some sealant was improperly or excessively installed, and some sealant has been installed where none is required or should be, such as in the rustication joints and possibly covering window weeps.

The loading dock on the east side of the building is exhibiting deterioration due to environmental exposure, presumably including the application of deicing chemicals.

LITTLEPAGE HALL

The concrete entrance walk on the west side of the upper level has settled where it abuts the concrete ramp leaving a one inch or better lip that presents a trip hazard.

- **Recommendations**

Patch deteriorated, spalled, and missing sections of cast-in-place concrete façade. This should be done to mitigate the ongoing deterioration of the distressed areas. (Estimate 200 sf.) Saw cut adjacent to exposed steel reinforcing with inadequate concrete cover; remove concrete behind the steel reinforcing, allowing it to be pounded in below the surface providing space for additional concrete cover over the existing steel reinforcing.

Fill the portion of the transverse spandrel soffit rustication strips from the existing drip channel to the face of the building with concrete repair mortar, in order to mitigate the travel of rainwater running in to the face of the wall and window walls. (Estimate 40 locations.)

Remove existing concrete coatings, prepare and coat all exposed cast-in-place concrete façade surfaces. This should be done to mitigate the ongoing deterioration of the distressed areas. (Estimate 8000 sf.)

Remove and replace all sealant joints in the façade which require sealant - not the joints that should not be sealed. (Estimate 650 lf.)

The removal and replacement of sealant joints and backer rod material around the windows is covered in the Windows and Doors section of this Report.

Remove and replace 10 feet of the concrete entrance walk at the south upper level entrance to eliminate the existing lip that presents a trip hazard.

Prepare, prime and paint all expose steel on the building exterior including, hand rails, steel angles at the loading dock, pipes, bollards, roof top HVAC units, conduit, grills, stairs, etc.

Apply urethane traffic membrane coating to the top surface of the loading dock.

Reference Drawings:
Facade drawings: F-35-1A and F-35-1B

Reference Photos: F-35-2A and 2B, 01 through 09

WINDOWS AND DOORS:

- **System Description**

Similar to Pathfinder Hall, Littlepage features 7-1/2" deep aluminum curtain wall framing with single pane glazing matching profiles and matching narrow profile entrance doors. With the exception of the entrance storefront framing, curtain wall framing members incorporated structural steel reinforcing. Finishes throughout were bronze anodized aluminum.

Upper level dining hall windows, as at Pathfinder, featured floor-to-ceiling fixed glass, with large upper vision glazing over lower spandrel glazing backed with rigid insulation and a reinforced porcelain enamel panel interior finish. Lower level office / lounge windows featured full height fixed vision glazing with an integral plastic laminated steel crash bar. (See Photo W-35-01).

The rear (west) loading door featured a pair of swinging hollow metal doors surmounted by painted metal insulated panels. (See Photo W-35-02). Two fixed louvers with matching bronze anodized aluminum finish were installed in the west and east supporting walls of the loading dock.

Upper level curtain wall systems remain as originally installed, with the exception of entrance storefronts, which have been replaced in their entirety with a slightly modified framing layout, insulated sash, and a bronze anodized aluminum finish darker than the original units. (See Photo W-35-03).

Lower level curtain wall systems have experienced significantly less replacement than at Pathfinder. All original curtain wall framing and glazing remains intact, including entrance storefronts. (See Photo W-35-04).

LITTLEPAGE HALL

- **Observations**

Littlepage Hall is essentially identical to Pathfinder Hall in original fenestration design, detailing and workmanship. Therefore, those comments noted for Pathfinder are common to Littlepage as well, and include the following in brief:

- Lack of thermal efficiency due to single glazing, and inadequate thermal break in curtain wall frame construction.
- Original aluminum finishes have maintained integrity over time.
- Original installation detailing provided inadequate cavity wall insulation and affords little through-wall protection against air infiltration.
- Perimeter sealants have failed typically and lack sufficient backup. (See Photo W-35-05).
- Original construction details indicate an integral connection between the curtain wall units and adjacent interior wall finishes and attached heating convectors. (See Photo W-35-06).
- Removal of existing curtain wall systems and related sealants, and the design of replacement systems, will need to be coordinated closely with asbestos abatement procedures, based on results of asbestos sampling and analysis (Refer to Asbestos Abatement section).
- Replacement fenestration at upper level entrance storefronts currently provides insulated sash.

- **Conclusions**

Original curtain wall units provide substandard thermal performance, and should be replaced with aluminum framed, insulated sash units capable of providing thermal performance that meets or exceeds current energy code requirements.

Curtain wall unit replacements can be undertaken with minimal additional impact to interior finishes and attached heating convectors. However, compatible aluminum trim components may be required to be designed and detailed.

Replacement of curtain wall systems will afford an opportunity to address original construction problems such as inadequate cavity wall insulation and sealant application.

Selected existing entry storefronts, although insulated sash replacements, should be replaced with new high-performance aluminum systems with finish to match new curtain wall units.

Curtain wall replacements should be carefully designed so as to provide optimum attachment, and sized to correctly apply perimeter sealants and back-up materials, including insulation. A sealant system should be designed and installed that anticipates the need to periodically remove and reinstall subsequent applications while not jeopardizing system integrity.

- **Recommendations**

Remove all existing curtain wall and door systems, including exterior and interior entrance storefront units. Provide temporary protection as necessary. (Refer to Asbestos Abatement Section.)

Remove all previous perimeter sealant applications. (Refer to Asbestos Abatement Section.)

Provide cavity wall insulation as necessary following exposure of wall interior construction.

Install new high-performance aluminum-framed curtain wall systems with fluoropolymer finish (AAMA 2605), narrow profile frames, insulated sash and compatible spandrel panels. Per campus directive, investigate the use of selective operable sash to provide natural ventilation to main dining hall, utilizing narrow profile operable sash framing within curtain wall framing in order to minimize sash frame profiles.

Install new aluminum-framed entrance storefronts at exterior and interior entry vestibules with insulated sash, medium stile door profiles and matching fluoropolymer finish.

Replace rear loading door, matching existing type, with painted finish to match proposed curtain wall framing finish. Existing metal panels above shall remain, painted to match proposed curtain wall framing finish.

LITTLEPAGE HALL

Replace all louvers with new fixed units, painted to match proposed curtain wall framing finish.

Provide polyurethane foam joint filler and new sealant system throughout.

Replace entrance storefront framing with a finish to match that of adjacent curtain wall replacement systems.

Provide new interior window treatments to match existing throughout.

Reference Drawings:
Elevation drawings: W-35-1A and W-35-1B
Window type elevations: W-35-2A through W-35-2C

Reference Photos: W-35-3A, 1 through 6

ASBESTOS AND PCBs:

- **System Description**

The window, roof and façade scopes will impact asbestos and PCB containing materials.

- **Observations**

The roof is an EPDM system. Suspect asbestos-containing materials were sampled and the results are outlined below.

- **Conclusions/Recommendations**

A reputable contractor in accordance with New York State Industrial Code Rule 56, and all applicable codes, rules and regulations must abate asbestos containing materials impacted by the scopes of this study.

Removal of PCB containing caulk generates a regulated hazardous waste. PCB containing materials shall be removed, handled and disposed of in accordance with current Federal, State and Local requirements. Contract specifications should be developed and included within Contract Documents when this project progresses to the point to do so.

Windows:
It is recommended that the windows in the work-out room in Littlepage Dining Hall be removed by the abatement contractor, due to the presence of asbestos containing window glaze around each window.

Roof:
It has been determined by laboratory analysis that the curb/penetration flashing cement associated with the roof mounted mechanical equipment and ductwork is asbestos containing. It is recommended that the abatement contractor remove the asbestos-containing roof curb/penetration flashing cement in its entirety and dispose of as asbestos containing material if this material will be impacted by planned renovations.

MECHANICAL, ELECTRICAL, PLUMBING:

- **System Description**

The heating system has a radiant fin tubing feed from the existing boiler system. The fin tubing is located along the wall assembly below the windows.

- **Observations**

The radiant heat tubing runs along the entire wall assembly. In some locations, the interior wall shows signs of damage. Wall heating assembly is wall mounted.

LITTLEPAGE HALL

Electrical outlets were found located below the existing fin tubing assembly. The outlets are fed from a riser in the wall column, and are then surface-mounted around the room.

- **Conclusions**

The existing heating system will need to be removed and reinstalled to avoid damage, and simplify the replacement of the curtain wall assemblies.
The existing wall outlets will need to be removed and reinstalled. All existing raceway may be reused.

- **Recommendations**

Replace with existing fin tubing enclosures to match.

CONNECTING TUNNELS & RETAINING WALLS

CONNECTING TUNNELS AND RETAINING WALLS

SITE ELEMENT DESCRIPTION:

The four link tunnels included below all are cast-in-place concrete box structures built into grade, have one façade of exposed concrete with windows and doors, and all function as retaining walls.

ROOF:

The existing roof membrane material and condition is not known and is not within the scope of this study. No roof leaks were reported by the facility; see Conclusions below.

- **System Description**

Location -1: The link tunnel from Pathfinder's east elevation lower level to the south elevation of Seneca Hall extends from Pathfinder Hall east 98' and then north 110' connecting to Seneca Hall. The roof of the tunnel structure is cast in place concrete. An earth and grass plaza extends onto and covers the tunnel roof. (See Photo R-CT-01).

Location – 2: Link tunnel between Pathfinder's west elevation lower level extends west about 41' and then north 43' and abuts the east side of Cayuga Hall's southeast corner. The roof of the tunnel structure is cast in place concrete with a waterproof membrane and concrete walks and paver plaza above. (See Photo R-CT-02).

Location – 6: The link tunnel from Littlepage Dining Hall to Onondaga Hall extends from the Littlepage Hall's north façade, lower level, north 36' and then west 110' connecting to the southeast corner of Onondaga Hall. The roof of the tunnel structure is cast in place concrete with an earth and grass plaza covering the tunnel roof. (See Photo R-CT-03).

Location – 7: The link tunnel from Littlepage Dining Hall to Oneida Hall extends from the south façade, lower level of Littlepage Hall, south about 60' and then east 112' connecting to the southeast corner of Oneida Hall. The roof of the tunnel structure is cast in place concrete with concrete walks and grass plaza covering the tunnel roof. (See Photo R-CT-04).

- **Observations**

Typical at all locations:
During a walking tour of the link tunnel interiors some locations of ceiling deterioration were observed but were attributed to water entering at the top of the windows not through the overhead. A vertical architectural reveal in the exterior concrete is centered on the punched window openings and returns into the window recess to the window head intersecting the drip channel. This configuration allows, and in fact channels, water along its length to the center of the window head. Once at the window head water will find any defect in the sealant joint at the perimeter of the window and enter the interior.

- **Conclusions**

In the absence of any known problems with the link tunnel roofs and the disruptive site intrusion that would need to be undertaken to properly assess the existing tunnel roof membranes the determination was made that no intrusion of the existing roof membranes should be done without some indication that there was a problem. At that time full roof membrane replacement would be advisable and undertaken as a project unto its self.

Two items loosely related to the roofing that are addressed in this study include:

- Loose or failing existing cap flashings installed in locations where the retaining walls abut adjacent buildings. The metal flashings were poorly designed and installed and are in need of replacement.

- Damage to the link tunnel roof membrane termination exposed metal counter flashing on the high side of the exposed link tunnel walls is loose and failing in several locations.

CONNECTING TUNNELS AND RETAINING WALLS

Ceiling deterioration within the link tunnel corridors appears to be caused by water entering at the top center of the window heads. The lateral drip channel cast into the exterior concrete across the head of the recessed window return is compromised by an architectural reveal that returns into the window recess intersecting the drip channel. This configuration allows, and in fact channels, water along its length from the façade to the center of the window head. Once at the window head water will find any defect in the sealant joint at the perimeter of the window and enter the interior. It is likely the reveal extends beyond the exterior face of the window and into the jamb. The bead of elastomeric sealant applied across the head of the window is destined to fail prematurely where it crosses the rustication reveal due to the inherent change of cross-section shape at the location of the reveal.

- **Recommendations**

Rehabilitate joint and metal flashing at all joints between the retaining walls and adjacent building facades.

Repair or replace damaged and failing metal counter flashings.

Reference Photos: R-CT-2A, 01 through 04

FAÇADES:

- **System Description**

Note: See Site location key map for additional information.

Location – 1: The link tunnel from Pathfinder's east side lower level extends east 98' and then north 110' connecting to the south elevation of Seneca Hall. The tunnel structure is cast in place concrete. The roof of the tunnel structure is cast in place concrete with a waterproof membrane, concrete walks and grass plaza above. The south and east facades are exposed concrete with punched, recessed window openings. The top of the exposed wall extends above the roof and upper grade 16" to 20". A bench/rail system constructed of concrete pillars, cast with the wall and precast concrete elements extend the length of the top of the wall. (See Photo F-CT-01).

Location – 2: The link tunnel between Pathfinder's west elevation lower level extends west about 41' and then north 43' and abuts the east side of Cayuga Hall's southeast corner. The roof of the tunnel structure is cast in place concrete with a waterproof membrane and concrete walks and plaza above. The south and west facades of the link tunnel are exposed concrete with punched recessed window openings. In the corner between the south façade of Cayuga Hall and the east façade of the of the link tunnel is an open cast in place concrete stairway consisting of two flights of stairs perpendicular to one another, with midlevel landing, concrete cheek walls with a short steel pipe rail on top. (See Photo F-CT-02).

Location – 3: Included in this study is the cast in place concrete retaining wall that extends 112' east-west between the southwest corner of Cayuga Hall and the northeast corner of Onondaga Hall. (See Photo F-CT-03). Centrally located in the length of the wall is an open, cast in place concrete stairway, consisting of two flights of switch back stairs, with a midlevel landing and a cantilevered top landing. A two rail metal pipe railing sets on low concrete cheek or stringer walls. At the top of the concrete retaining wall is a bench/rail system constructed of concrete pillars cast into the top of the wall, with the wall and precast concrete bench elements set in between. (See Photo F-CT-04).

Location – 4: Two low concrete retaining walls extend 70' north from the northeast and northwest corners of Pathfinder Dining Hall bordering a paved loading dock access and parking area on the north side of the building. (See Photo F-CT-05).

Location – 5: Included in this study is the cast in place concrete retaining wall at the north east corner of Seneca Hall. This retaining wall extends east 72' from the corner of the building and then continues south 128'. The top of the wall slopes from about 14' high at the building down to grade at the south end. Set into the top of the wall and extending the full length of the concrete retaining wall is a two rail, painted metal guard rail, constructed of square tubing. (See Photo F-CT-06).

Location – 6: The link tunnel from Littlepage Dining Hall to Onondaga Hall extends from the north façade, lower level of Littlepage Hall, north 36' and then west 110' connecting to the southeast corner of Onondaga

Hall. The roof of the tunnel structure is cast in place concrete with concrete walks and grass plaza covering the tunnel roof. The north and east facades are exposed concrete with punched, recessed window openings. The top of the exposed wall extends above the roof and upper grade 10" to 15". A bench/rail system constructed of concrete pillars, cast with the wall, and precast concrete elements between extends the length of the top of the wall. (See Photo F-CT-07).

Location – 7: The link tunnel from Littlepage Dining Hall to Oneida Hall extends from the south façade, lower level of Littlepage Hall, south about 60' and then east 112' connecting to the southeast corner of Oneida Hall. The roof of the tunnel structure is cast in place concrete with concrete walks and grass plaza covering the tunnel roof. The south and east facades are exposed concrete with punched, recessed window openings. The top of the exposed wall extends above the roof and upper grade 10" to 12". A bench/rail system constructed of concrete pillars, cast with the wall, and precast concrete elements between extends the length of the top of the north-south wall and the east half of the east-west façade wall. The remaining wall has a painted metal pipe rail with vertical pipe balusters about 2' on center. (See Photo F-CT-08).

- **Observations**

Structurally, all the retaining walls and link tunnel structures are generally in good condition.

The concrete surfaces have been exposed to the environment for forty plus years and are in need of maintenance.

There are numerous locations on the concrete façade elements where areas of the concrete surface have spalled, broken, cracked, or deteriorated. (See Photo F-CT-09).

Most, of the cast-in-place concrete façade element surfaces have been extensively rubbed, or parged, after stripping the forms during the original construction. (See Photo F-CT-10).

Many of the concrete surfaces have thin hairline cracking or other evidence of minor surficial distress. (See Photo F-CT-11).

The rustication strips in the soffits of the window recesses which are transverse to the facade span, that is, perpendicular to the building façade, allow water to run from the face of the facade to the surface of the window frame. This is evidenced by staining of the window soffit and the intersecting area of the window. (See Photo F-CT-12).

Many of the sealant joints around the windows and doors are deteriorated. Deterioration includes gaps, adhesive failure, and cohesive failure.

Some of the shallow revels in the concrete façade elements have been filled with elastomeric sealant. (See Photo F-CT-13).

The exterior concrete stairs are in similar condition as the cast-in-place concrete retaining wall elements. Concrete spalling is a little more prevalent, likely due to the greater prevalence of deicing salts.

Vertical movement joints between retaining walls, the tunnel connecting links and abutted buildings are all in a deteriorated state. The cap flashing on the top lacks design durability and longevity. (See Photo F-CT-14).

Link tunnel roof membrane metal counter flashing is exposed in some areas and has come loose. (See Photo F-CT-15).

- **Conclusions**

Environmental exposure and original construction imperfections, have led to deterioration. Manifestations of the deterioration and imperfections include:

- Areas of inadequate concrete cover over reinforcing bars.
- Over-rubbed surfaces, and delaminating parging.

Areas of concrete which are not adequately resistant to freeze-thaw conditions, possibly the result of inadequate air entrainment by overworking or poor curing conditions.

Inappropriate open-cell backer rod in the sealant joints around the windows, which may have contributed to

water migration and intrusion around the windows.

The transverse rustication strips at the midspan of the window head soffits deliver precipitation to the window frame, compromising the lateral drip channel rustication. This leads to staining, acceleration of soffit deterioration, and amplifies any window or sealant condition which could cause leakage.

Years of exposure to environmental conditions has deteriorated the surfaces of the cast-in-place concrete façade elements. Acid rain reacts with the alkaline components of concrete, increased carbon dioxide in the air contributes to carbonation of the concrete that results in the concrete absorbing precipitation and condensation moisture at an increasing rate over time. Stress created within the concrete due to freezing of absorbed water causes spalling of the concrete surface, both micro and large spalls. Steel reinforcing placed during construction with inadequate concrete cover is at increased risk of being exposed to moisture and air that results in rusting. The expansive nature of rust results in additional spalling of the concrete surface.

A multitude of sealant campaigns, presumably to address water intrusion issues, has been done without complete removal of the previous sealant, some of the work has adhesive failure, some sealant was improperly or excessively installed, and some sealant has been installed where none is required or should be, such as in the rustication joints and possibly covering window weeps.

The exterior concrete stairs have deterioration aggravated by the application of deicing chemicals.

- **Recommendations**

Patch deteriorated, spalled, and missing sections of cast-in-place concrete façade. This should be done to mitigate the ongoing deterioration of the distressed areas.

Fill the window head returns and transverse spandrel soffit rustication strips with concrete repair mortar, in order to mitigate the travel of rainwater running in to the face of the windows.

Prepare and coat all exposed cast-in-place concrete site-wall façade surfaces with a waterproof, elastomeric acrylic emulsion coating. This should be done to mitigate the ongoing deterioration of the distressed areas.

Remove and replace all sealant joints in the façade which require sealant - not the joints that should not be sealed.

Rehabilitate exterior stairs: Patch concrete, repair treads, prepare and paint steel.

Note: The removal and replacement of sealant joints and backer rod material around the windows is covered in the Windows section of this Report.

Facade drawings: F-CT-1A through F-CT-1D

Reference Photos: F-CT-2A through 2C, 01 through 15

WINDOWS AND DOORS:

- **System Description**

At all four connecting tunnels, windows and doors were recessed within the cast-in-place concrete exterior walls, and spanned full height from the tunnel floor to the underside of the concrete roof above. The original window units consisted of 4" deep aluminum framing, with a single sliding window with single pane glazing over an opaque porcelain enamel panel. Sill, jamb, head and intermediate mullion framing members were 1" wide. Finishes throughout were bronze anodized aluminum. Without exception, these window units remain as originally installed. (See Photo W-CT-01).

Doors were typically constructed of narrow profile glazed aluminum entrance doors, with full-height single pane glazing and aluminum frames. The exception was the Littlepage/Oneida tunnel door, which was

constructed of a flush hollow metal door and frame. Without exception, these units have been replaced with painted hollow metal doors and frames, composed of a variety of door size, opening infill and glazing layouts. (See Photo W-CT-02).

Location – 1: This link tunnel extends from Pathfinder's lower level east elevation to the basement level south elevation of Seneca Hall. The east wall includes nine windows; the south wall includes seven windows and one door.

Location – 2: This link tunnel extends from Pathfinder's lower level west elevation to the basement level south elevation of Cayuga Hall. The west wall includes four windows; the east wall includes two windows and one door.

Location – 6: This link tunnel extends from Littlepage's lower level north elevation to the basement level south elevation of Onondaga Hall. The north wall includes three windows; the east wall includes one door.

Location – 7: This link tunnel extends from Littlepage's lower level south elevation to the basement level east elevation of Oneida Hall. The south wall includes three windows; the east wall includes one door.

- **Observations**

Original window units, due to single glazed sash and lack of thermal breaks in framing available at the time of construction, are inherently energy inefficient. Further, in selected locations, wind-driven rain has penetrated the sealant locations and damaged adjacent interior finishes. (See Photo W-CT-03).

Despite some fade and color variation between panel and frame, the original duranodic finish on the aluminum, now almost forty-five years old, has held up remarkably well, preserving unit integrity.

Analysis of original construction details raises some questions as to the integral connection of the window unit and adjacent interior wall finishes, and whether window units can be replaced without impacting interior finishes and attached heating convectors. This is further complicated by the fact that the four connecting tunnels were constructed at different times during the construction history of the west campus; in fact, the four tunnels are detailed in four different sets of construction documents. Further, an analysis of these construction drawings and existing construction indicates that the interior wall conditions and materials used vary from tunnel to tunnel. For example:

- Cayuga / Pathfinder tunnel: A continuous vertical separation, or joint, exists full height between the window unit and flanking walls. (See Photo W-CT-04). An analysis of construction drawings and on-site observation indicate that the interior finish of adjacent walls is plaster, while the lower window spandrel backup is finished with gypsum wallboard.
- Seneca / Pathfinder tunnel: No vertical separation, or joint, exists between the lower window unit (spandrel) and flanking walls. An analysis of construction drawings and on-site observation indicate that both the interior finish of adjacent walls and lower window spandrel backup finish is plaster. In addition, vertical cracks in the plaster exist at all of these lower walls in alignment with the separation between the window units and adjacent exterior walls. (See Photo W-CT-05).
- Oneida / Littlepage tunnel: No vertical separation, or joint, exists between the lower window unit (spandrel) and flanking walls. An analysis of construction drawings and on-site observation indicate that both the interior finish of adjacent walls and lower window spandrel backup finish is plaster. Unlike the similar construction noted in the Seneca / Pathfinder tunnel, however, there is no evidence of vertical cracks in the plaster of the lower walls.
- Onondaga / Littlepage tunnel: No vertical separation, or joint, exists between the lower window unit (spandrel) and flanking walls. An analysis of construction drawings and on-site observation indicate that the interior finish of adjacent walls is plaster, while the lower window spandrel backup is finished with gypsum wallboard, with what appears to be a thin layer of gypsum wallboard joint compound spanning between the adjacent dissimilar finishes.

Previous investigation revealed the absence of cavity wall insulation, blocking, and closed cell backer rod behind perimeter sealants.

CONNECTING TUNNELS AND RETAINING WALLS

Perimeter sealants between window frame and adjacent aggregate wall panels have failed typically, despite successive applications, as noted in Façade Observations.

Subsequent to the original construction, security screen systems have been added to all tunnel windows. The campus has indicated that the security screen function will need to be maintained when the window systems are replaced. (See Photo W-CT-01).

Replacement of window systems will be impacted by continuous wall-mounted heating convectors in all window locations, and wire mold along ceiling in most locations (none at Oneida / Littlepage tunnel). Refer to MEP section. (See Photo W-CT-04).

Removal of existing curtain wall systems and related sealants, and the design of replacement systems, will need to be coordinated closely with asbestos abatement procedures, based on results of asbestos sampling and analysis (Refer to Asbestos Abatement section).

- **Conclusions**

As components of the larger six-building complex, system components of the tunnel windows and doors (frame finish, window glazing, spandrel colors, and door sash) should match or compliment the adjacent residence hall and dining hall fenestration selections.

Original window units provide substandard thermal performance, and should be replaced with high-performance aluminum-framed, insulated sash units.

Replacement of windows will allow for the application of cavity wall insulation.

The result of the analysis of the differing existing spandrel backup finish conditions will need to be investigated more closely, possibly with some investigative demolition, in order to determine the correct level of demolition and construction detailing for each typical tunnel condition. When this analysis indicates that lower spandrel backup finishes are required to be included in the demolition of the window units, existing floor and base, with possible associated abatement implications, may become involved.

New window security screens will need to be included with the window unit replacements.

Existing tunnel doors should be replaced with door systems offering longevity and high performance, with finish to match new windows. Decisions regarding material selection, size, extent of glazing and overall layout (use of sidelight and transom) should be based on aesthetics, long-term maintenance and security concerns.

The building's window and door systems have a history of improperly selected and poorly installed sealant systems, which should be replaced.

- **Recommendations**

Remove all existing window and door systems; provide temporary protection as necessary. (Refer to Asbestos Abatement section).

Remove all previous perimeter sealant applications.

Provide cavity wall insulation as necessary following exposure of wall interior construction.

Install new high-performance aluminum-framed sliding window units with fluoropolymer finish, narrow profile frames, insulated sash, integral screens, and spandrel glazing in lower panel. Resolve interior finish issues (retention or removal of spandrel backup finish and separation of spandrel interior finish with adjacent walls) following further site investigation, use of custom aluminum interior trim components, and coordination with adjacent heating convectors, wire mold, and existing flooring and base.

Install new security screens at operable sash; provide matching frame finish and narrow frame depth in order to integrate aesthetically with adjacent window systems.

Install new hollow metal exterior doors, frames sidelights and transoms with finish to match window replacements. Specify glazing options, hardware and security tie-ins in conjunction with existing systems and campus standards.

Provide closed cell backer rod and sealant system throughout.

ASBESTOS AND PCBs:

- **System Description**

The window and façade scopes will impact asbestos and PCB containing materials.

- **Observations**

Window units within the adjoining tunnels of Pathfinder contain an asbestos cement backer board on the bottom panels. The tunnel windows are adjacent to asbestos containing spray-on ceiling plaster and asbestos containing floor tile.

Window units within the adjoining tunnels of Littlepage contain an asbestos cement backer board on the bottom panels. The tunnel windows are adjacent to asbestos containing spray-on ceiling plaster and asbestos containing floor tile (floor tile not present in tunnel to Oneida).

- **Conclusions/Recommendations**

A reputable contractor in accordance with New York State Industrial Code Rule 56, and all applicable codes, rules and regulations must abate asbestos containing materials impacted by the scopes of this study.

Removal of PCB containing caulk generates a regulated hazardous waste. PCB containing materials shall be removed, handled and disposed of in accordance with current Federal, State and Local requirements. Contract specifications should be developed and included within Contract Documents when this project progresses to the point to do so.

Windows:
It is recommended that the window units within the two adjoining tunnels to both Pathfinder and Littlepage shall be removed by the abatement contractor, due to the presence of the asbestos cement backer board within the window panel, the asbestos containing ceiling plaster that the window tops are adjacent to, and the asbestos containing floor tile and associated mastic that the window bottoms are adjacent to. The materials removed in this process must be disposed of as asbestos containing.

MECHANICAL, ELECTRICAL, PLUMBING:

- **System Description**

The heating system has a radiant fin tubing feed from the existing boiler system. The fin tubing is located along the wall assembly below the windows.

- **Observations**

The radiant heat tubing runs along the entire wall assembly. In some locations, the wall interior wall shows signs of damage. Wall heating assembly is wall-mounted. The existing enclosures are layered in paint.

- **Conclusions**

The existing heating system will need to be removed and reinstalled to avoid damage, and simplify the replacement of the window assemblies.

- **Recommendations**

Replace with existing fin tubing enclosures to match.

ASBESTOS TECHNICAL MEMORANDUM

STATE UNIVERSITY OF NEW YORK
OSWEGO, NEW YORK

TECHNICAL MEMORANDUM

PATHFINDER AND LITTLEPAGE DINING HALL FEASIBILITY STUDY

DASNY D#116504; JDE# 2938509999

Prepared For:
Woolley Morris Architects
401 N. State Street
Syracuse, NY 13203

Prepared By:
Ravi Engineering & Land Surveying, P.C.
2110 S. Clinton Avenue, Suite 1
Rochester, NY 14618

November 2010

Project No. 40-10-066

Preface

An Asbestos Technical Memorandum and PCB Technical Memorandum have been completed as part of the Dining Hall Feasibility Study of Pathfinder and Littlepage Dining Halls at the State University of New York at Oswego. The results of this Study are included in this report and are presented in two Volumes dated November 2010, namely:

Volume 1 of 2: Asbestos Technical Memorandum

Volume 2 of 2: PCB Technical Memorandum

ASBESTOS EXECUTIVE SUMMARY

The State University of New York at Oswego is conducting a feasibility study of Pathfinder and Littlepage Dining Halls for potential replacement of the current window systems (including those windows in adjoining tunnels in both dining halls), the current roof systems and renovation of the exterior façades including stairs and retaining walls.

An Asbestos Technical Memorandum for the Feasibility Study was prepared. Representative accessible areas that have the potential to be impacted by potential renovations (window, roof, façade) were inspected within the Pathfinder and Littlepage Dining Hall interior and exterior.

This Study included a record review, visual inspection and collection of suspect asbestos containing materials (ACM's). At Pathfinder Dining Hall, thirty-three (33) different homogeneous areas were identified, from which twenty-four (24) samples were collected; at Littlepage Dining Hall, thirty-five (35) homogeneous areas were identified, from which eighteen (18) samples were collected. All forty-two (42) samples were submitted to AmeriSci New York for asbestos content determination.

The following tables indicate the materials are asbestos containing (>1% asbestos) based on either record review or laboratory analysis. This estimate of quantities of asbestos containing materials is limited to anticipated impact of this study; it is NOT inclusive of the entire building. Quantity units are in either square feet (SF) or linear feet (LF).

PATHFINDER DINING HALL & ADJOINING TUNNELS		
Homogeneous Area No.	**Description**	**Quantity**
5	Cement board behind plaster topcoat and substrate, drywall and Styrofoam insulation	250 SF
6	White ceiling plaster on concrete deck	32 SF
7	9"x9" floor tile	72 SF
8	Black floor tile mastic	72 SF
19	2'x2' SAT with holes and ½" gashes	640 SF
25	Exterior caulk- light grey extremely sticky window caulk- west elevation between bottom of window frame and concrete	50 LF
28	Chocolate brown/charcoal grey window caulk between metal and concrete- upper windows, south elevation	7 SF
31	Black EPDM roof material	16,220 SF
32	Black EPDM roof seam caulk ≈ 2" wide	12,230 LF

PATHFINDER DINING HALL & ADJOINING TUNNELS		
Homogeneous Area No.	Description	Quantity
33	Black roof penetration caulk	100 LF

LITTLEPAGE DINING HALL & ADJOINING TUNNELS		
Homogeneous Area No.	Description	Quantity
6	White ceiling plaster on concrete deck	10 SF
7	9"x9"FT cream with tan, light brown specks and swirls	95 SF
8	Black floor tile mastic	95 SF
9	Interior glaze- black, sticky between metal frame and glass window	1,000 LF
14	2'x2' white SAT with holes and ½" gashes	640 SF
32	Cement board behind plaster topcoat and substrate, drywall and Styrofoam insulation	70 SF
33	Black EPDM roof material	16,220 SF
34	Black EPDM roof seam caulk ≈ 2" wide	12,230 LF
35	Black roof penetration caulk	100 LF

The AHERA and DASNY Sampling protocols were not followed for this study. The recommendations indicated at the end of this report are based on limited sampling collected for this study and the general understanding of the various scopes. Additional asbestos inspection, sample collection, and scope definition would be necessary to facilitate an asbestos abatement design.

In accordance with 12 NYCRR 56, no renovation work shall be commenced by any owner or agent prior to completion of asbestos abatement performed by a licensed asbestos abatement contractor.

RE: State University of New York at Oswego
Dining Hall-Feasibility Study
Volume 1 of 2: Asbestos Technical Memorandum

SUBJECT: Pathfinder and Littlepage Dining Hall Feasibility Study

---

INTRODUCTION

Woolley Morris Architects retained Ravi Engineering & Land Surveying, P.C. (RE&LS) to perform a Pathfinder and Littlepage Dining Hall Feasibility Study at the State University of New York at Oswego campus, Oswego, New York. The required license and certifications to conduct this work are included in Attachment A.

PROJECT OVERVIEW

Pathfinder and Littlepage both are two-story structural concrete and masonry dining halls located on the SUNY Oswego campus. The campus intends to replace the current window systems (including those windows in adjoining tunnels in both dining halls), the current roof systems and to renovate the exterior façades including stairs and retaining walls. The survey was necessary to determine potential asbestos impacts of the intended renovations; and included a review of available records (contained in Attachment B), a visual inspection and collection of samples. Site investigations were conducted on October 22 and 26, 2010. The results of the Feasibility Study are presented in this Technical Memorandum.

ASBESTOS BULK SAMPLING

Representative bulk samples of suspect asbestos containing materials (ACM's) were collected by New York State Department of Labor (NYSDOL) certified inspectors from RE&LS. A copy of RE&LS's license and inspectors' certifications can be found in Attachment A.

Friable bulk asbestos samples were analyzed using NYS ELAP Method EPA 600/M4/82/020 (Polarized Light Microscopy (PLM)). Non-friable organically bound (NOB) asbestos samples were analyzed using NYS ELAP Method 198.6 (PLM) and, if found to be less than or equal to 1% asbestos containing, NYS ELAP Method 198.4 (Transmission Electron Microscopy (TEM)). AmeriSci New York was the NYSDOH approved laboratory used for analysis. A copy of AmeriSci's credentials can be found in Attachment A.

A total of forty-two (42) asbestos bulk samples were collected; 24 at Pathfinder and 18 at Littlepage, and were sent in for laboratory analysis.

The bulk sample locations are indicated on the bulk sample location plans included in Attachment C. The sample identification number indicated on the sketch corresponds to the identification number on the laboratory analytical report, the bulk sample log, and the chain of custody forms; all of which are located in Attachment D.

ASBESTOS RESULTS/FINDINGS

As defined by the NYSDOL 12NYCRR 56, a sample is considered to be asbestos containing if it contains greater than 1% asbestos by weight based on laboratory analysis.

The tables below indicate the materials that were identified as part of this study and the results of those samples that were collected for analysis. Bold and italicized rows indicate that the material is asbestos containing based on laboratory analysis or confirmed asbestos containing based on record review.

1: PATHFINDER DINING HALL & ADJOINING TUNNELS			
Homogeneous Area No.	**Description**	**Sample Number**	**Asbestos Content and Type of Analysis**
1	White plaster wall topcoat	B001-1A B007-1B	None Detected-PLM

TEM denotes Transmission Electron Microscopy

NA denotes Not Analyzed

PLM denotes Polarized Light Microscopy

[1] Previous samples collected and determined to be non-asbestos containing (see Attachment B)

[2] Previous samples collected and determined to be asbestos containing (see Attachment B)

[3] Record as-built drawings indicate flooring to be Vinyl Asbestos Tile (see Attachment B)

[4] Inaccessible due to ceiling height; until further verification, this material is assumed to be asbestos containing

[5] Material is non-suspect but was identified in study for ease of identifying associated materials

[6] Same material identified in other buildings and determined to be asbestos containing transite

[7] Roof materials were not sampled at this time, until further verification, this material is assumed to be asbestos containing

ASBESTOS MATERIALS AND ESTIMATE OF QUANTITIES

Asbestos exists throughout the inspected areas based on analytical results of this inspection and information gathered from the record review. The following table indentifies the Homogeneous Areas that are asbestos containing along with the material description and approximate quantity. This estimate of quantities of asbestos containing materials is limited to anticipated impact of this study; it is NOT inclusive of the entire building. Quantity units are in either square feet (SF) or linear feet (LF).

PATHFINDER DINING HALL & ADJOINING TUNNELS		
Homogeneous Area No.	**Description**	**Quantity**
5	Cement board behind HA#'s 1, 2, 3, 4	250 SF
6	White ceiling plaster on concrete deck	32 SF
7	9"x9" floor tile	72 SF
8	Black floor tile mastic	72 SF
19	2'x2' SAT with holes and ½" gashes	640 SF
25	Exterior caulk- grey extremely sticky window caulk	50 LF
28	Chocolate brown/charcoal grey window caulk between metal and concrete- upper windows, south elevation	7 SF
31	Black EPDM roof material	16,220 SF
32	Black EPDM roof seam caulk	12,230 LF
33	Black roof penetration caulk	100 LF

LITTLEPAGE DINING HALL & ADJOINING TUNNELS		
Homogeneous Area No.	**Description**	**Quantity**
6	White ceiling plaster on concrete deck	10 SF
7	9"x9"FT cream with tan, light brown specks and swirls	95 SF
8	Black floor tile mastic	95 SF
9	Interior caulk- black, sticky between metal frame and glass window	1,000 LF
14	2'x2' white SAT with holes and ½" gashes	640 SF
32	Cement board behind HA#'s 4, 5, 31	70 SF
33	Black EPDM roof material	16,220 SF

LITTLEPAGE DINING HALL & ADJOINING TUNNELS		
Homogeneous Area No.	Description	Quantity
34	Black EPDM roof seam caulk	12,230 LF
35	Black roof penetration caulk	100 LF

LIMITATIONS (each limitation that has a preceding number has a subsequent recommendation with the same preceding number.)

1. The asbestos inspection and sampling conducted for this study was limited to the general areas that could be impacted by the Feasibility Study Scope. AHERA regulations, 40 CFR Part 763.86 and 763.87, NYS Code Rule 56 and DASNY protocols with regards to number of samples collected were not followed.

2. Documentation of previous sampling is identified as a "reference only" document. The past sampling that is referenced in this technical memorandum was adopted from this "reference only" document located in Attachment B.

3. Materials that were not accessible were not sampled and are therefore assumed to be asbestos containing until further verification.

4. To avoid potential roof leaks, the EPDM roof systems on both buildings were not sampled and are assumed to be asbestos containing.

5. HA#6 in Pathfinder (white ceiling plaster topcoat) was determined to contain trace amounts of asbestos. Ceiling plaster with this same appearance has been positive for asbestos content in several other buildings on campus. Until further sampling is completed, this material is assumed to be asbestos containing.

6. The plaster substrate in either tunnel attached to Pathfinder dining hall were determined to be different. Since this survey did not include a complete room-by-room survey and bulk sampling of all existing suspect materials within the building, the plaster substrate within Pathfinder Dining Hall proper is assumed to be both HA# 2 and HA# 29.

7. HA#29 collected at Littlepage Dining Hall was visible only because a portion of the window frame was missing. It is unknown if a comparable material exists within the Pathfinder Dining Hall windows.

8. The as-built record drawing for Pathfinder Dining Hall entitled "Tunnel Plan, Elevations, Sections and Details," dated February 18, 1965, Plan No. A-21, indicates a ¼" cement asbestos board back-up material within the window panel system between the porcelain enamel and the

Styrofoam rigid insulation. The record drawing for Littlepage Dining Hall entitled "Tunnel Plan, Elevations, Sections and Details," dated October 3, 1966, Plan No. A-21, does not indicate an asbestos cement board within the window panel system (record drawings located in Attachment B). Contrary to the record drawing, this material is present as visually observed from a wall core.

9. The estimate of quantities of asbestos containing materials used within this study are based on areas of impact with regards to the various scopes within this study (window, roof, façade) and is not inclusive of the entire building.

RECOMMENDATIONS

Asbestos containing materials have been identified as part of this study. In accordance with 12 NYCRR 56, no renovation work shall be commenced by any owner or agent prior to completion of asbestos abatement performed by a licensed asbestos abatement contractor. RE&LS recommends, and NYSDOL regulations require, that all of the asbestos containing materials that will be impacted by the intended renovation be removed prior to the renovation.

It is recommended that the windows located in both tunnels at Pathfinder and Littlepage be removed by the abatement contractor; due to the presence of the asbestos cement backer board within the window panel, the asbestos containing ceiling plaster that the window tops are adjacent to and the asbestos containing floor tile and associated mastic that the window bottoms are adjacent to.

It is recommended that the windows in the work-out room in Littlepage Dining Hall be removed by the abatement contractor; due to the presence of asbestos containing window glaze around each window.

It is recommended that the upper windows in the center of Pathfinder Dining Hall, west elevation, be removed by the abatement contractor; due to the presence of asbestos containing caulk located along the bottom and half way up the far left and right side of the unit.

It is recommended that the upper windows on the left side of Pathfinder Dining Hall, south elevation, be removed by the abatement contractor; due to the presence of assumed asbestos containing window caulk located on the far left and right side of the unit, full height.

1. It is recommended that a formal Asbestos Pre-Renovation Survey be completed by a NYSDOL certified inspector and subsequent samples be analyzed by a NYSDOH laboratory prior to the planned renovations outlined in this feasibility study.

2. When a formal Asbestos Pre-Renovation Survey is completed, it is recommended that proper analytical documentation be gathered to verify the accuracy of samples referenced in the "reference only" document.

3. It is recommended that coordination be set in place to sample those materials that were inaccessible due to either ceiling or window height.

4. It is recommended that all roofing materials be sampled for asbestos content verification at a later time prior to roof renovations

5. It is recommended that additional ceiling plaster samples be collected in the Pathfinder Dining hall tunnels to verify asbestos content.

6. Two different plaster substrates within the adjoining tunnels to Pathfinder Dining Hall were found not to contain asbestos. It is recommended that verification of plaster wall systems be completed within the main portion of Pathfinder Dining Hall to properly adhere to AHERA sampling protocols with regards to required number of samples.

7. It is recommended that further investigation be completed to verify if there are any additional caulk materials behind the exterior window frames at Pathfinder Dining Hall.

8. It is assumed from visual observation that the same cement asbestos board back-up material exists within the porcelain enamel window panels at Littlepage Dining Hall. It is recommended that this material be sampled to verify asbestos content.

9. If there are additions to the various scopes as this project progresses, it is recommended that the quantities of impacted asbestos containing materials be recalculated.

Job Number 210104309
P.O. #40-10-066
40-10-066; Feasibility Study At PATHFINDER Dining Hall; SUNY Oswego, Oswego, New York 13126; Ravi Phase #: 40-102-01

Dear Jim Mussgnug:

Enclosed are the results of Asbestos Analysis - Bulk Protocol of the following Ravi Engineering & Land Surveying, P.C. samples, received at AmeriSci on Thursday, October 28, 2010, for a 5 day turnaround:

B001-1A, B001-2A, B001-3A, B001-5A, B001-6A, B001-9A, B001-10A, B001-11A, B001-12A, B002-13A, B003-14A, B006-16A, 1001-18A, EE-20A, EE-21A, EE-22A, EE-23A, EE-24A, EN-25A, EW-26A, EW-27A, B007-1B, B007-29A, B007-30A

The 24 samples, placed in Zip Lock Bag, were shipped to AmeriSci via UPS. Ravi Engineering & Land Surveying, P.C. requested ELAP PLM/TEM analysis of these samples.

The results of the analyses which were performed following ELAP Protocols 198.1 PLM Friable and/or 198.6 for PLM NOB. ELAP Protocol 198.4 TEM NOB guidelines are presented within the Summary Table of this report. The presence of matrix reduction data in the Summary Table normally indicates an NOB sample. For NOB samples the individual matrix reduction, combined PLM and TEM analysis results are listed in the Summary Bulk Asbestos Analysis Results in Table I. Complete PLM results for individual samples are presented in the PLM Bulk Asbestos Report. This combined report relates ONLY to sample analysis expressed as percent composition by weight and percent asbestos. This report must not be used to claim product endorsement or approval by these laboratories, NVLAP, ELAP or any other associated agency. The National Institute of Standards and Technology Accreditation requirements, mandates that this report must not be reproduced, except in full without the written approval of the laboratory. This report may contain specific data not covered by NVLAP or ELAP accreditations respectively, if so identified in relevant footnotes.

AmeriSci appreciates this opportunity to serve your organization. Please contact us for any further assistance or with any questions.

Sincerely,

Paul J. Mucha
Laboratory Director

Analyst Description: Grey, Homogeneous, Non-Fibrous, Bulk Material
Asbestos Types:
Other Material: Cellulose 2 %, Non-fibrous 98 %

Reporting Notes:

Analyzed by: David W. Roderick

*NAD/NSD =no asbestos detected; NA =not analyzed; NA/PS=not analyzed/positive stop; PLM Bulk Asbestos Analysis by EPA 600/M4-82-020 per 40 CFR 763 (NVLAP Lab Code 200546-0), ELAP PLM Method 198.1 for NY friable samples or 198.6 for NOB samples (NY ELAP Lab ID11480); Note:PLM is not consistently reliable in detecting asbestos in floor coverings and similar non-friable organically bound materials. NAD or Trace results by PLM are inconclusive, TEM is currently the only method that can be used to determine if this material can be considered or treated as non asbestos-containing in NY State (also see EPA Advisory for floor tile,FR 59,146,38970,8/1/94). National Institute of Standards and Technology Accreditation requirements mandate that this report must not be reproduced except in full without the approval of the lab. This PLM report relates ONLY to the items tested. AIHA Lab# 102843.

Analyzed by: Madell E. Collins Madell E Collins; Date Analyzed 11/2/2010

**Quantitative Analysis (Semi/Full); Bulk Asbestos Analysis - PLM by EPA 600/M4-82-020 per 40 CFR or ELAP 198.1 for New York friable samples or ELAP 198.6 for New York NOB samples; TEM (Semi/Full) by EPA 600/R-93/116 (not covered by NVLAP Bulk accreditation); or ELAP 198.4 for New York samples; NAD = no asbestos detected during a quantitative analysis; NA = not analyzed; Trace = <1%; Quantitation for beginning weights of <0.1 grams should be considered as qualitative only; Qualitative Analysis: Asbestos analysis results of "Present" or "NVA = No Visible Asbestos" represents results for Qualitative PLM or TEM Analysis only (no accreditation coverage available from any regulatory agency for qualitative analyses); AIHA Lab # 102843, NVLAP Lab Code 200546-0, NYSDOH ELAP LAB ID 11480.

Warning Note: PLM limitation, only TEM will resolve fibers <0.25 micrometers in diameter. TEM bulk analysis is representative of the fine grained matrix material and may not be representative of non-uniformly dispersed debris for which PLM evaluation is recommended (i.e. soils and other heterogenous materials).

Analyst Description: Grey, Homogeneous, Non-Fibrous, Bulk Material
Asbestos Types:
Other Material: Non-fibrous 8.2 %

Reporting Notes:
Analyzed by: David W. Roderick
*NAD/NSD =no asbestos detected; NA =not analyzed; NA/PS=not analyzed/positive stop; PLM Bulk Asbestos Analysis by EPA 600/M4-82-020 per 40 CFR 763 (NVLAP Lab Code 200546-0), ELAP PLM Method 198.1 for NY friable samples or 198.6 for NOB samples (NY ELAP Lab ID11480); Note:PLM is not consistently reliable in detecting asbestos in floor coverings and similar non-friable organically bound materials. NAD or Trace results by PLM are inconclusive, TEM is currently the only method that can be used to determine if this material can be considered or treated as non asbestos-containing in NY State (also see EPA Advisory for floor tile,FR 59,146,38970,8/1/94). National Institute of Standards and Technology Accreditation requirements mandate that this report must not be reproduced except in full without the approval of the lab. This PLM report relates ONLY to the items tested. AIHA Lab # 102843.

Re: SUNY Oswego – Pathfinder and Littlepage Dining Halls
Limited Asbestos Bulk Sampling & Analysis – Roof Sampling
AECOM Project No.: 60139355

Dear Mr. Williams:

This letter and attachments represent AECOM's report for the above-referenced project.

Introduction

AECOM was retained by the Dormitory Authority State of New York (DASNY) to conduct limited bulk sampling and analysis of suspect asbestos-containing material (ACM) roof systems at Pathfinder and Littlepage Dining Halls located at SUNY Oswego in Oswego, New York. The sampling was performed in compliance with New York State Industrial Code Rule 56 (ICR 56).

The sampling was conducted on February 18, 2011 by AECOM representative Thomas Wilkinson who was escorted and shown specific areas to be sampled by Klepper, Hahn & Hyatt representative Douglas Arena. Mr. Wilkinson is a New York State Department of Labor (DOL) certified asbestos building inspector. Copies of applicable certifications are provided in Attachment A.

Results and Discussion

Representative bulk sampling, as directed by Mr. Arena, was conducted in 2 areas of the roof deck along with multiple locations of caulking materials on each roof at Pathfinder and Littlepage Halls. Non-friable organically bound (NOB) materials were analyzed in accordance with New York State Department of Health (DOH) requirements. NOBs are first subjected to an ashing and acid washing procedure to properly break down the material. The sample is then analyzed by PLM for asbestos content. If asbestos is found, the analysis is complete. However, a negative result must be confirmed by using transmission electron microscopy (TEM). All samples were analyzed by AmeriSci, New York.

The sampling included the collection of 36 non-friable/NOB material samples. 18 samples were collected from Pathfinder Hall and 18 samples were collected from Littlepage Hall. Laboratory reports and chain-of-custody forms are included in Attachment B. Sample locations are shown on Figures 1 and 2 in Attachment C. Sample results are summarized in the following tables. Materials found to be asbestos – containing (i.e., >1%) are denoted in **BOLD** type.

Mr. Jamie Williams

NA/PS signifies Not Analyzed/Positive Stop

In accordance with ICR 56, all material determined to be asbestos – containing must be removed by a licensed contractor prior to building renovation or demolition activities which would disturb the asbestos – containing material.
The DOL also requires that a copy of this report be provided to the Commissioner of Labor at the following address:

New York State Department of Labor
Division of Safety and Health
Asbestos Control Bureau
450 South Salina St.
Syracuse, New York 13202

If you have any questions, please call us at (315) 432-0506. It was a pleasure working with you on this project and I hope we can be of service in the future.

Sincerely,
AECOM

This license has been issued in accordance with applicable provisions of Article 30 of the Labor Law of New York State and of the New York State Codes, Rules and Regulations (12 NYCRR Part 56). It is subject to suspension or revocation for a (1) serious violation of state, federal or local laws with regard to the conduct of an asbestos project, or (2) demonstrated lack of responsibility in the conduct of any job involving asbestos or asbestos material.

This license is valid only for the contractor named above and this license or a photocopy must be prominently displayed at the asbestos project worksite. This license verifies that all persons employed by the licensee on an asbestos project in New York State have been issued an Asbestos Certificate, appropriate for the type of work they perform, by the New York State Department of Labor.

Reporting Notes:
Analyzed by: Bella J. Chernis Bella Chernis

*NAD/NSD =no asbestos detected; NA =not analyzed; NA/PS=not analyzed/positive stop; PLM Bulk Asbestos Analysis by EPA 600/M4-82-020 per 40 CFR 763 (NVLAP Lab Code 200546-0), ELAP PLM Method 198.1 for NY friable samples or 198.6 for NOB samples (NY ELAP Lab ID11480); Note:PLM is not consistently reliable in detecting asbestos in floor coverings and similar non-friable organically bound materials. NAD or Trace results by PLM are inconclusive. TEM is currently the only method that can be used to determine if this material can be considered or treated as non asbestos-containing in NY State (also see EPA Advisory for floor tile,FR 59,146,38970,8/1/94). National Institute of Standards and Technology Accreditation requirements mandate that this report must not be reproduced except in full without the approval of the lab. This PLM report relates ONLY to the items tested. AIHA Lab # 102843.

Other Material: Non-fibrous 13.7 %

Reporting Notes:
Analyzed by: Bella J. Chernis Bella Chernis

*NAD/NSD =no asbestos detected; NA =not analyzed; NAPS=not analyzed/positive stop; PLM Bulk Asbestos Analysis by EPA 600/M4-82-020 per 40 CFR 763 (NVLAP Lab Code 200546-0); ELAP PLM Method 198.1 for NY friable samples or 198.6 for NOB samples (NY ELAP Lab ID 11480); Note: PLM is not consistently reliable in detecting asbestos in floor coverings and similar non-friable organically bound materials. NAD or Trace results by PLM are inconclusive. TEM is currently the only method that can be used to determine if this material can be considered or treated as non asbestos-containing in NY State (also see EPA Advisory for floor tile, FR 59, 146, 38970, 8/1/94). National Institute of Standards and Technology Accreditation requirements mandate that this report must not be reproduced except in full without the approval of the lab. This PLM report relates ONLY to the items tested. AIHA Lab # 102843.

PCB EXECUTIVE SUMMARY

The State University of New York at Oswego is conducting a feasibility study of Pathfinder and Littlepage Dining Halls for potential replacement of the current window systems (including those windows in adjoining tunnels in both dining halls), the current roof systems and renovation of the exterior façades including stairs and retaining walls.

A PCB Technical Memorandum for the Feasibility Study was prepared. Representative accessible areas that have the potential to be impacted by potential renovations (window, roof, façade) were inspected within the Pathfinder and Littlepage Dining Hall interior and exterior.

This Study included a visual inspection and collection of suspect PCB containing caulks and glazing. At Pathfinder Dining Hall, twelve (12) different caulk/glazing materials were identified and sampled; at Littlepage Dining Hall, eleven (11) different caulk/glazing materials were identified and sampled. All twenty-three (23) samples were submitted to either AmeriSci Boston or Paradigm Environmental for analysis.

The following tables indicate the caulk/glazing materials that are PCB containing (≥ 50 ppm) based on analytical results.

RE: State University of New York at Oswego
Dining Hall-Feasibility Study
Volume 2 of 2: PCB Technical Memorandum

SUBJECT: Pathfinder and Littlepage Dining Hall Feasibility Study

---

INTRODUCTION

Woolley Morris Architects retained Ravi Engineering & Land Surveying, P.C. (RE&LS) to perform a Pathfinder and Littlepage Dining Hall Feasibility Study at the State University of New York at Oswego campus, Oswego, New York.

PROJECT OVERVIEW

Pathfinder and Littlepage are two story structural concrete and masonry dining halls located on the SUNY Oswego campus. The campus intends to replace the current window systems (including windows in adjoining tunnels in both dining halls), the current roof systems and to renovate the exterior facades including stairs and retaining walls. The survey was necessary to determine potential PCB containing caulk/glazing impacts of the intended renovations; and included a visual inspection and collection of samples. Site investigations were conducted on October 22 and 26, 2010. The results of the feasibility study are presented in this technical memorandum.

PCB CAULK SAMPLING

A total of twenty-three (23) samples were collected; 12 at Pathfinder and 11 at Littlepage. Each caulk or glaze that was sampled, was also sampled and analyzed for asbestos content as part of the

2110 S. Clinton Ave, Suite 1
Rochester, New York 14618
p: 585-223-3660
f: 585-223-4250
www.ravieng.com
info@ravieng.com

complimentary November 16, 2010 Technical Memorandum, "Pathfinder and Littlepage Dining Hall Feasibility Study." Each PCB sample number for this study contains the corresponding HA# found in the asbestos feasibility study.

The suspect PCB caulks and glazes that were collected were submitted for laboratory analysis. Bulk PCB samples were analyzed using EPA Method 8082. AmeriScri Boston and Paradigm Environmental Services were the NYSDOH-approved laboratories used for analysis. A copy of Paradigm's and AmeriSci's credentials can be found in Attachment A.

The sample locations are indicated on PCB Sample Location Plans included in Attachment B. The sample numbers indicated on the plans correspond to the sample numbers on the laboratory analytical reports and the chain of custody forms, which are included in Attachment C.

PCB RESULTS/FINDINGS

The Environmental Protection Agency (EPA) defines PCB bulk waste as, "waste derived from manufacturing products containing PCB's in a non-liquid state, at any concentration where concentration at the time of designation for disposal was ≥ 50 ppm PCB's."

The tables below indicate the caulk and/or glazing materials that were identified as part of this study and subsequent analytical results received from AmeriSci Boston and Paradigm Environmental Services. Samples that are ***Bold and italicized*** are ≥ 50 ppm.

1: PATHFINDER DINING HALL & ADJOINING TUNNELS-PCB SAMPLE SUMMARY			
Sample Location	**Sample Description**	**Sample Number**	**PCB Content**
Tunnel to Seneca	***Interior caulk- tan, crumbly original caulk between metal and plaster on top of radiator***	***PCB-B001-9***	***82.7 ppm***
Tunnel to Seneca	***Interior caulk- original grey/brown, crumbly window caulk between metal and plaster***	***PCB-B001-12***	***61.9 ppm***
Room in University Police	Interior caulk-white, flexible window caulk between metal and plaster	PCB-B002-13	7.96 ppm
Room in University Police	Interior caulk- black, semi-sticky window caulk between metal and metal in UPD	PCB-B003-14	27.5 ppm
Room in University Police	Interior caulk- blue, flexible, sticky	PCB-B006-16	29.8 ppm
Exterior east	***Exterior caulk- tan, flexible, powders when rubbed between stone wall slabs and stone wall/concrete columns***	***PCB-EE-20***	***3950-4570 ppm***
Exterior east	***Exterior caulk- light grey, gum-like at base of bldg.***	***PCB-EE-21***	***590-1870 ppm***

1: PATHFINDER DINING HALL & ADJOINING TUNNELS-PCB SAMPLE SUMMARY			
Sample Location	**Sample Description**	**Sample Number**	**PCB Content**
Exterior east	Exterior caulk- medium grey, flexible seam caulk	PCB-EE-22	8.6-13.6 ppm
Exterior east	Exterior caulk- dark grey, flexible, smooth (top bead of metal base board of retaining wall (east side only))	PCB-EE-23	None Detected
Exterior north	***Exterior caulk- med./dark grey, flexible caulk at base of bldg.***	***PCB-EN-24***	***34.9-173 ppm***
Exterior west	***Exterior caulk- light grey extremely sticky window caulk- west elevation between bottom and far sides of window frame and concrete***	***PCB-EW-25***	***3300-6630 ppm***
Exterior west	***Exterior caulk-battleship grey, semi-flexible caulk***	***PCB-EW-27***	***3420 ppm***
Exterior south	***Chocolate brown/charcoal grey window caulk between metal and concrete- upper windows, south elevation***	***Not sampled[1]***	***NA***
Roof	***Black EPDM roof seam caulk ≈ 2" wide***	***Not sampled[2]***	***NA***
Roof	***Black roof penetration caulk***	***Not sampled[2]***	***NA***

2: LITTLEPAGE DINING HALL & ADJOINING TUNNELS-PCB SAMPLE SUMMARY			
Homogeneous Area No.	**Description**	**Sample Number**	**PCB Content**
Tunnel to Onondaga	Interior white, crumbly caulk between metal and plaster on top of radiator	PCB-B001-3	2.04 ppm
Tunnel to Onondaga	***Interior glaze- black, sticky between metal frame and glass window***	***PCB-B002-9***	***344 ppm***
Exterior north	***Exterior caulk-light tan/cream, flexible between concrete and concrete***	***PCB-EN-21***	***7490-8560 ppm***
Exterior north	***Exterior caulk-grey/brown/smoky charcoal grey rubber-like door caulk between metal door frame and concrete***	***PCB-EN-22***	***50.7 ppm***
Exterior north	Light grey/off-white exterior seam caulk between sidewalk panels and between stone wall panels	PCB-EN-23	4.54-6.96 ppm
Exterior west	Exterior caulk-cream, flexible, powders when rubbed between stone wall panels over HA#21	PCB-EW-25	33.9 ppm
Exterior north	***Exterior window glaze-black, very stretchy between glass and metal***	***PCB-EN-26***	***11.1-61.7 ppm***

2: LITTLEPAGE DINING HALL & ADJOINING TUNNELS-PCB SAMPLE SUMMARY			
Homogeneous Area No.	**Description**	**Sample Number**	**PCB Content**
Exterior north	Charcoal grey/brown window glaze/caulk, flexible	PCB-EN-27	None Detected
Exterior north	***Exterior caulk-cream (original) window caulk, existing original caulk behind window frame (visible only because window frame was broken at one section)***	***PCB-EN-28***	***61,000 ppm***
Exterior south	***Exterior caulk-metallic grey seam caulk between concrete and concrete at base of building***	***PCB-ES-29***	***5920 ppm***
Exterior south	Exterior caulk-grey, flexible seam caulk between concrete and concrete on retaining wall cube bases and tunnel seams	PCB-ES-30	None Detected
Roof	***Black EPDM roof seam caulk ≈ 2" wide***	***Not sampled[1]***	***NA***
Roof	***Black roof penetration caulk***	***Not sampled[1]***	***NA***

NA denotes Not Analyzed

[1] Roof materials were not sampled at this time; until further verification, these materials are assumed to be PCB containing

LIMITATIONS

Materials that were not accessible were not sampled and are therefore assumed to be PCB containing until further verification.

To avoid potential roof leaks, the EPDM roof systems on both buildings were not sampled, caulks present on the roof are assumed to be PCB containing.

Sample identification number PCB-ES-29 collected at Littlepage Dining Hall was visible only because a portion of the window frame was missing. It is unknown if a comparable material exists within the Pathfinder Dining Hall windows.

RECOMMENDATIONS

Due to the presence of PCBs in caulk, it is recommended that a PCM removal specification be included within the Contract Documents as the project progresses since the scopes of this study will impact PCB containing window caulks/glazing and seam caulk.

Removal of PCB containing caulk generates a regulated hazardous waste. It is recommended that Federal and State regulations for generation, waste characterization, transport and disposal be adhered to.

It is recommended that coordination be set in place to sample those materials that were inaccessible.

It is recommended that all roofing materials be sampled for PCB content verification at a later time prior to roof renovations.

It is recommended that further investigation be completed to verify if there are any additional caulk materials behind the exterior window frames at Pathfinder Dining Hall.

UPS Internet Shipping: View/Print Label

1. **Print the label(s):** Select the Print button on the print dialog box that appears. Note: If your browser does not support this function select Print from the File menu to print the label.

2. **Fold the printed label at the solid line below.** Place the label in a UPS Shipping Pouch. If you do not have a pouch, affix the folded label using clear plastic shipping tape over the entire label.

3. **GETTING YOUR SHIPMENT TO UPS**

   Customers without a Daily Pickup

   Schedule a same day or future day Pickup to have a UPS driver pickup all of your Internet Shipping packages.

   Hand the package to any UPS driver in your area.

   Take your package to any location of The UPS Store®, UPS Drop Box, UPS Customer Center, UPS Alliances (Office Depot® or Staples®) or Authorized Shipping Outlet near you. Items sent via UPS Return Services℠ (including via Ground) are also accepted at Drop Boxes.

   To find the location nearest you, please visit the 'Find Locations' Quick link at ups.com.

   Customers with a Daily Pickup

   Your driver will pickup your shipment(s) as usual.

Sample Receiving Form

CLIENT: RAVI Engineering	WORKORDER: 1010-298
CLIENTS JOB: 40-10-066; PCB	RECEIVED BY: pp
RECEIVED DATE: 10/28/10	SHIPPING METHOD: UPS
TEMP UPON RECEIPT: Ambient	

"No" responses must be explained in the comment section below.

Checklist	YES	NO	NA
Were custody seals on shipping container(s) intact? Check "NA" if no seals, or if containers were hand delivered.			X
Were Chain of Custody Forms included with the samples?	X		
Were Chain of Custody Forms properly filled out (ink, signed, etc.)	X		
Were all containers received in good condition (Check for breakage/ leaks)?	X		
Were all containers labeled with required information (Sample Id, date, signed, analysis, preservation)?	X		
Were the correct containers used for the tests indicated?	X		
Were proper preservation techniques indicated?			X
Were samples received within holding times? If "NO" nonconformance form is required.	X		
Were all VOA bottles checked for the presence of air bubbles? If bubbles were found please note in the comment section.			X
Were samples in direct contact with wet ice? If "NO" check one: ☐ Blue Ice ☒ No Ice		X	
Is sample temperature recorded ? If "NO" check one: ☐ Unable to record ☐ Temp taken near samples	X		
Were pHs of samples checked and recorded on the COC forms?			X
Did the laboratory accept samples?	X		
Will samples be subcontracted? If "yes" list subcontractor and tests in specified sections below.		X

Analytical Report Cover Page

Ravi Engineering

For Lab Project #10-4495
Issued November 5, 2010
This report contains a total of 3 pages

The reported results relate only to the samples as they have been received by the laboratory.

Any noncompliant QC parameters having impact on the data are flagged or documented on the final report.

All soil/sludge samples have been reported on a dry weight basis, unless qualified "reported as received". Other solids are reported as received.

Each page of this document is part of a multipage report. This document may not be reproduced except in its entirety, without the prior consent of Paradigm Environmental Services, Inc.

The Chain of Custody provides additional information, including compliance with sample condition requirements upon receipt. Sample condition requirements are defined under the 2003 NELAC Standard, sections 5.5.8.3.1 and 5.5.8.3.2.

NYSDOH ELAP does not certify for all parameters. Paradigm Environmental Services or the indicated subcontracted laboratory does hold certification for all analytes where certification is offered by ELAP unless otherwise specified.

Data qualifiers are used, when necessary, to provide additional information about the data. This information may be communicated as a flag or as text at the bottom of the report. Please refer to the following list of frequently used data flags and their meaning:

"<" = analyzed for but not detected at or above the reporting limit.
"E" = Result has been estimated, calibration limit exceeded.
"Z" = See case narrative.
"D" = Duplicate results outside QC limits. May indicate a non-homogenous matrix.
"M" = Matrix spike recoveries outside QC limits. Matrix bias indicated.
"B" = Method blank contained trace levels of analyte. Refer to included method blank report.

G Surrogate recoveries are not reported due to sample dilution.

To the best of my knowledge this report is true and accurate.

UPS Internet Shipping: View/Print Label

1. **Print the label(s):** Select the Print button on the print dialog box that appears. Note: If your browser does not support this function select Print from the File menu to print the label.

2. **Fold the printed label at the solid line below.** Place the label in a UPS Shipping Pouch. If you do not have a pouch, affix the folded label using clear plastic shipping tape over the entire label.

3. **GETTING YOUR SHIPMENT TO UPS**
   Customers without a Daily Pickup
   Schedule a same day or future day Pickup to have a UPS driver pickup all of your Internet Shipping packages.
   Hand the package to any UPS driver in your area.
   Take your package to any location of The UPS Store®, UPS Drop Box, UPS Customer Center, UPS Alliances (Office Depot® or Staples®) or Authorized Shipping Outlet near you. Items sent via UPS Return Services℠ (including via Ground) are also accepted at Drop Boxes.
   To find the location nearest you, please visit the 'Find Locations' Quick link at ups.com.

   Customers with a Daily Pickup
   Your driver will pickup your shipment(s) as usual.

SCI-SOP-1003
Sample Receiving Form

CLIENT: RAVE Engineering	WORKORDER: 1010-297
CLIENTS JOB: 40-10-066 ; PCB	RECEIVED BY: MP
RECEIVED DATE: 10/28/10	SHIPPING METHOD: UPS
TEMP UPON RECEIPT: Ambient	

"No" responses must be explained in the comment section below.

Checklist	YES	NO	NA
Were custody seals on shipping container(s) intact? Check "NA" if no seals, or if containers were hand delivered.			X
Were Chain of Custody Forms included with the samples?	X		
Were Chain of Custody Forms properly filled out (ink, signed, etc.)	X		
Were all containers received in good condition (Check for breakage/ leaks)?	X		
Were all containers labeled with required information (Sample Id, date, signed, analysis, preservation)?	X		
Were the correct containers used for the tests indicated?	X		
Were proper preservation techniques indicated?			X
Were samples received within holding times? If "NO" nonconformance form is required.	X		
Were all VOA bottles checked for the presence of air bubbles? If bubbles were found please note in the comment section.			X
Were samples in direct contact with wet ice? If "NO" check one: ☐ Blue Ice ☒ No Ice		X	
Is sample temperature recorded ? If "NO" check one: ☐ Unable to record ☐ Temp taken near samples	X		
Were pHs of samples checked and recorded on the COC forms?			X
Did the laboratory accept samples?	X		
Will samples be subcontracted? If "yes" list subcontractor and tests in specified sections below.		X	
Subcontractor: Date Sent Out:			
Analyses Sent:
