- E. Design Meeting #4 University Police Dispatch Center 6-11-2012

#### 1. PROJECT SUMMARY

#### **A. PROJECT BACKGROUND:**

Located within the West Campus area of SUNY Oswego, Littlepage and Pathfinder Dining Halls are part of a six-building complex intended to serve four adjacent residence halls. Four connecting tunnels link the six primary buildings together. Built in the late 1960's to early 1970's, this complex was designed and constructed of similar scale, materials, and colors, and intended to read as a single large composition. Aside from selective roof repairs, door replacements, and the addition of security screens to the connecting tunnel windows, much of Littlepage and Pathfinder Dining Halls' original construction remain intact.

#### **B. PROJECT DESCRIPTION:**

The exterior portion of work proposed under the Contract for this project is based on the feasibility study "West Campus Dining Hall Building Shell Improvements" dated May 10, 2011. This study provided Littlepage and Pathfinder Dining Hall building observations as well as recommendations to address roof, façade, windows and doors, MEP systems, and abatement concerns. The rehabilitation of and addition to the Glimmerglass Fitness Center portion of work proposed under the Contract for this project is based on the "Fitness/Student Activities Master Plan" dated December 2011. This master plan assessed the existing conditions and needs for indoor fitness campus-wide and recommended an expansion of and improvements to the current Glimmerglass Fitness Center in Littlepage Dining Hall as the best near and long term strategy.

#### **C. SCOPE OF WORK:**

#### 1. Exterior Building Shell Improvements:

#### Roof

The roofs at Littlepage and Pathfinder Dining Halls are flat, essentially square, with an area of approximately 16,000 SF. The typical roof assembly for each building consists of 60mil EPDM membrane adhered to Polyisocyanurate taper board hot mopped to 3 1/2" Polyisocyanurate board hot mopped to 3-ply vapor retarder hot mopped to concrete deck. The typical roof perimeter at each building is terminated on the top of a low cast-in-place concrete parapet capped with a metal gravel stop flashing. The EPDM membrane extends up the interior face, over the top of the low parapet and terminates at the top outer edge of the gravel stop flashing. A single-story centrally located penthouse, approximately 760 SF in size, sits above each main roof, along with roof drains, ventilation ductwork, and a lightning protection system around the perimeter.

STATE UNIVERSITY OF NEW YORK COLLEGE AT OSWEGO DASNY PROJECT JDE # 299390 FAA PROJECT # 11024.06

The following roof work is recommended for each building:

- Remove existing EPDM membrane and roof assembly down to the vapor retarder.
- Install new white EPDM membrane, tapered insulation, and 3 1/2" rigid insulation to the existing vapor retarder and concrete deck.
- Replace all perimeter parapet wall flashings and edge metals with new.
- Replace existing roof drain strainers with lockable type or cast-iron type.
- Replace existing walkway pads with fully-bonded pads.
- Add fully-bonded walkway pads below equipment and wiring currently draped across the membrane surface.

The roofs at the four Connecting Tunnels are all cast-in-place concrete box structures built into grade, have one façade of exposed concrete with windows and doors, and all function as retaining walls. Each Connecting Tunnel is covered with either an earth and grass plaza or a waterproof membrane with concrete walks and paver plaza.

The following roof work is recommended for each Connecting Tunnel:

- Rehabilitate joint and metal flashing at all joints between the retaining walls and adjacent building facades.
- Repair or replace damaged and failing metal counter flashing.

#### Facade

The façade at Littlepage and Pathfinder Dining Halls consist of exposed cast-in-place concrete columns with spandrel beams that extend out proud of the plane of the façade. The bays formed by the concrete beams and columns are in-filled with either glass curtain wall or exposed aggregate precast concrete wall panel. Each building has a concrete loading dock which provides direct access to the receiving area of the kitchen on the upper level. The loading docks each have a set of metal tread stairs located to the side for pedestrian access, however, there are no guardrails.

The following façade work is recommended for each building:

- Patch deteriorated, spalled, and missing sections of cast-in-place concrete façade. Where required, saw cut the area adjacent to the exposed steel reinforcing in order to pound the steel reinforcing below the surface for additional concrete repair coverage.
- Add pitch to the existing spandrel soffit rustication strips by filling in the portion from the existing drip channel to the face of the building with concrete repair mortar.
- Prepare and coat all exposed cast-in-place concrete façade surfaces.
- Remove all existing sealant joints and replace with new sealant.
- Prepare, prime, and paint all exposed steel on the building exterior including hand rails, steel

angles at the loading docks, pipes, bollards, roof top HVAC units, conduit, grills, stairs, etc.

- Apply urethane traffic membrane coating to the top surface of each loading dock.
- Only at Littlepage Dining Hall, remove and replace 10 FT of the concrete entrance walk at the south upper level entrance to eliminate the existing lip that presents a trip hazard.
- Only at Pathfinder Dining Hall, repair deteriorated concrete landing at stair area.

The façade at the four Connecting Tunnels to both the Littlepage and Pathfinder Dining Halls is exposed concrete with punched, recessed door and/or window openings. A vertical architectural reveal in the exterior concrete is centered on the punched door/window openings and returns into the door/window recess to the door/window head intersecting the drip channel. The top of the exposed walls display either a bench/rail system constructed of concrete pillars, cast with the wall, and precast concrete elements between each pillar or a painted metal pipe railing. At one of the Connecting Tunnels there is also a corner concrete stairway consisting of two flights of stairs perpendicular to one another, with mid-level landing, concrete cheek walls, and a short painted metal pipe rail on top.

The following façade work is recommended for each Connecting Tunnel:

- Patch deteriorated, spalled, and missing sections of cast-in-place concrete façade.
- Fill in the door/window head returns and transverse spandrel soffit rustication strips with concrete mortar repair.
- Prepare and coat all exposed cast-in-place concrete site-wall façade surfaces with waterproof, elastomeric acrylic emulsion coating.
- Remove all existing sealant joints and replace with new sealant.
- Only at one Connecting Tunnel, rehabilitate exterior corner concrete stairway by patching concrete, repairing treads, and prepping and painting existing metal pipe rails.

#### Windows

The upper and lower level windows at Littlepage and Pathfinder Dining Halls consist of 7 1/2"-deep bronze anodized aluminum curtain wall framing with single pane glazing and matching narrow profile entrance doors. Typical sill framing is 7 1/2" high; head, jamb, and mullion framing is 2 1/2" wide. With the exception of the entrance storefront framing, all other framing members incorporate structural steel for reinforcing. The upper level dining hall windows feature floor-to-ceiling fixed glass with large upper vision glazing over the lower spandrel glazing backed with rigid insulation and a reinforced porcelain enamel panel interior finish. While the lower level windows at Littlepage remain original, a significant portion of the lower level windows at Pathfinder have been replaced to meet the needs of the Campus Police Department.

The following window work is recommended for each building:

 Remove all existing curtain wall (and door) systems, including all previous perimeter sealant applications.

STATE UNIVERSITY OF NEW YORK COLLEGE AT OSWEGO DASNY PROJECT JDE # 299390 FAA PROJECT # 11024.06

- Provide cavity wall insulation as necessary following exposure of wall interior construction.
- Install new high-performance aluminum framed curtain wall systems with fluoropolymer finish, narrow profile frames, insulated sash, and compatible spandrel panels.
  - o Fenestration to be based on two panel widths; 5'-0" and 4'-6"
  - Glazing colors, tints, and frame finish to borrow from the existing residence hall glazing system
  - Provide a 4" wide projecting fin to breakdown the scale and permit partition attachment where required, primarily at the University Campus Police Department office in Pathfinder
  - Refer to the Glimmerglass Fitness Center, Dining Hall, and University Police sections for additional window information.
- Provide polyurethane foam joint filler and new sealant system throughout.
- Provide new interior window treatments to match existing throughout.

The windows at the four Connecting Tunnels are recessed within the cast-in-place concrete exterior walls, spanning full height from the tunnel floor to the underside of the concrete roof above. The original window units consist of 4" deep bronze anodized aluminum framing with a single window with single pane glazing sliding over an opaque porcelain enamel panel. Typical sill, head, jamb, and mullion framing is 1" wide.

The following window work is recommended for each Connecting Tunnel:

- Remove all existing window systems, including all previous perimeter sealant applications, and provide temporary protection as necessary.
- Provide cavity wall insulation as necessary following exposure of wall interior construction.
- Install new high-performance aluminum framed curtain wall systems with fluoropolymer
  finish, narrow profile frames, insulated sash, and spandrel glazing in lower panel. Resolve
  interior finish issues with custom aluminum interior trim components, coordinating with
  adjacent heating convectors, wire mold, and existing flooring/base.
- Provide closed cell backer rod and sealant system throughout.

#### **Doors**

The doors at Littlepage and Pathfinder Dining Halls are narrow profile entrance doors incorporated within the same 7 1/2"-deep bronze anodized aluminum curtain wall framing system used for the windows. These entrance doors are typically finished in a matching bronze anodized aluminum; however the entrance door to the Campus Police Department was installed in a blue color finish. Doors located at the rear loading dock area of each building feature a pair of swinging hollow metal doors surmounted by painted metal insulated panels. Fixed louvers in a matching bronze anodized aluminum finish are also installed in the supporting walls of the loading dock.

The following door work is recommended for each building:

FAA PROJECT # 11024.06

- Remove all existing door systems, including all previous perimeter sealant applications, and provide temporary protection as necessary.
- Provide cavity wall insulation as necessary following exposure of wall interior construction.
- Install new aluminum-framed entrance storefronts at exterior and interior entry vestibules with insulated sash, medium stile door profiles, and matching fluoropolymer finish.
- Replace rear loading dock doors in-kind with new, in a painted finish to match the proposed curtain wall framing finish. The existing metal panels above shall remain, painted to match the proposed curtain wall framing finish.
- Replace all existing louvers with new fixed units, painted to match proposed curtain wall framing finish.
- Provide polyurethane foam joint filler and new sealant system throughout.

The doors at the four Connecting Tunnels are also recessed within the cast-in-place concrete exterior walls, spanning full height from the tunnel floor to the underside of the concrete roof above. The existing door units consist of painted hollow metal doors and frames in a variety of door sizes, opening infill scenarios, and glazing layouts.

The following door work is recommended for each Connecting Tunnel:

- Remove all existing door systems, including all previous perimeter sealant applications, and provide temporary protection as necessary.
- Provide cavity wall insulation as necessary following exposure of wall interior construction.
- Install new hollow metal exterior doors, frames, sidelights, and transoms with finish to match
  new window replacements. Specify glazing options, hardware, and security tie-ins in
  conjunction with existing systems and campus standards.
- Provide closed cell backer rod and sealant system throughout.

#### 2. Rehabilitation of & Addition to Glimmerglass Fitness Center:

(Please refer to the attached Proposed Drawings)

The Glimmerglass Fitness Center, located in the lower level of Littlepage Dining Hall, is an open fitness/exercise area with limited support spaces, approximately 7,200 SF, to serve West Campus residents. Due to overcrowding of the existing limited space available, particularly at peak times, the following is recommended in regards to the rehabilitation of and addition to the existing Glimmerglass Fitness Center:

• Primary exterior main entry moved to north side of the building. Able to internalize the main entry in lieu of an entry addition. There are also secondary exterior entries from tunnels on both the north and south sides of the building.

STATE UNIVERSITY OF NEW YORK COLLEGE AT OSWEGO DASNY PROJECT JDE # 299390 FAA PROJECT # 11024.06

- Propose pre-engineered translucent canopies installed at primary north main entry and at secondary south tunnel entry. Up-lighting of each canopy is also possible and recommended to create a focal point.
- Provide access to both men's and women's locker areas directly from the entry/reception area.
- A simplified pavilion shape to the addition on the north side of the building will reduce the roof impact on the upper level dining views and reduce costs.
- All lower level glazing to be fixed.
- A 4,650 SF addition to the existing fitness center space will provide a total of 7,550 SF useable space; 6,500 SF designated for fitness and another 1,050 SF designated for women's strength & conditioning.
- Propose developing the expanded fitness center space on two levels with an 18" floor change; grade change permits views over the lower fitness area, improves roof obstruction from dining views above, and permits cardio-vascular exercise equipment at multiple locations with views out.
- Create a multi-purpose room of 1,150 SF. Wall between multi-purpose room and lower fitness level to have mirrors on both sides with clerestory glazing above to borrow natural lighting from the lower fitness level.
- Option to provide toilets off the lower level corridor for dining hall users.

#### 3. Dining Hall Improvements:

The dining operations located in the upper level of both Littlepage and Pathfinder Dining Halls are intended to serve the West Campus residents. The dining halls, approximately 7,750-8,300 SF in size, offer two straight-line servers with secondary stations for drinks, salads, and desserts. The existing servers are in good condition and the existing dining room finishes are acceptable; however the indoor air quality and temperature controls are problematic. While the HVAC concerns are addressed separately, the following is recommended in regards to improvements to the existing dining halls:

- All upper level glazing to consist of 2'-6" lower spandrel, 7'-0" high vision panel, and 3'-6" tinted or frit panel above.
- New interior window treatments to match existing is addressed in the Window section.
- Option of an integral horizontal sun shade is also possible as part of the glazing above the vision panel to reduce heat gain effect.
- Update existing railing (plywood) infill at stair guards with new to meet code compliance.
- Integrate serving stations (similar to Lakeside) into the existing straight-line cafeteria system.
- Integrate pedestrian/car/truck traffic patterns at entrance areas.

• Provide new screening at otherwise functional loading dock area. Possibly provide new screening at dumpsters as well.

#### 4. University Police Improvements:

(Please refer to the attached Proposed Drawings)

The University Campus Police Department, located in the lower level of Pathfinder Dining Hall, operates in approximately 7,200 SF of office and support space to serve the entire campus population. As reported by members of the Department, the existing office spaces are inefficient, utilized inadequately, and often poorly located for their uses. Due to these problematic issues, and to meet accreditation requirements, the following is recommended in regards to improvements to the existing University Campus Police Department office:

- Provide a welcoming and identifiable entrance as there was a user group discussion regarding the un-inviting and fortress-like appearance to the building/office.
- Propose pre-engineered translucent canopy installed at main entrance in lieu of existing
  concrete structure. Up-lighting of the canopy is also possible and recommended to create a
  welcoming and identifiable police presence on campus.
- The existing site wall located in front of the main entrance could also be cut down 12"-18" to alleviate fortress-like appearance and exterior signage could be applied.
- Propose new arrangements/locations for the following:
  - Office/administrative functions concentrated to the east side of the building
  - o Operations functions concentrated to the west side of the building
  - o Relocate armory to the west side of the building
  - Eliminate bifurcation of the department by moving dispatch center and lay it out in a more user-friendly configuration
  - Relocate conference room to the east/administrative side of the office and allow for exterior window access
  - o Relocate evidence room and add a vestibule to meet accreditation requirements
  - Relocate and expand the lieutenants' office
- All lower level glazing to have narrow ventilator casement and a mixture of spandrel and vision panel glazing, mostly spandrel for security purposes.
- Replace existing acoustic ceiling tiles with new to rectify humidity damage evident on existing tiles as referenced in the Mechanical & Plumbing section.

#### 5. Mechanical & Plumbing:

#### **Littlepage Dining Hall**

#### General

The basis of design, as presented below, is a general description of the concepts and systems proposed for the new facility. All equipment will be designed per the following codes:

- Building Code of New York State
- Mechanical Code of New York State
- Plumbing Code of New York State
- Energy Conservation Construction Code of New York State
- Fuel Gas Code of New York State
- Fire Code of New York State

#### **Central Mechanical/Plumbing System**

The Littlepage building is currently provided with district stream generated at the campus power plant. The medium pressure steam (mps) is supplied to the building at approximately 50 psig through a 5" mps line that enters the steam room in the South west corner. The 5" mps line connects to a high/low pressure reducing station where it reduces to 12-15 psig low pressure steam (lps). Once reduced in pressure, the steam supplies a 6" lps header equipped with multiple supply taps serving the heating hot water heat exchanger located within the steam service room, the domestic water heater located in the adjacent mechanical space, and the kitchen equipment located on the floor above. A duplex condensate receiver, housed within the steam service room, serves as the central collection point for all steam condensate utilized within the building. Once collected, the duplex receiver pumps the condensate back to the campus power plant. The heating hot water generated in the steam-to-hot water heat exchanger is circulated through two sets of circulator pumps – one set of pumps (rated at 2-hp) serving the perimeter radiation system and one set of pumps (rated at 10-hp) serving the pre-heat and reheat coils located within the supply air ductwork.

An additional "summer" steam boiler, condensate receiver, and surge tank is housed in a separate boiler room within the building. The "summer" boiler serves as a back-up heat source for the building during periods when the main campus power plant is shut down for annual maintenance or as needed during emergency steam back-up conditions.

The main steam pressure reducing station, condensate receiver, steam-to-hot water heat exchanger, hot water circulating pumps, distribution piping (steam, condensate and hot water), and valves appear to be original to the building (constructed in the mid 1960's). Based on the American Society of Heating Refrigeration and Air Conditioning Engineers (ASHRAE) recommendations (reference ASHRAE 2011 HVAC Applications Chapter 37), the existing equipment has exceeded its estimated service life. With the added load resulting from the proposed fitness center expansion and the expectations that the building systems shall be capable of efficient operations for the next 20+ years,

STATE UNIVERSITY OF NEW YORK COLLEGE AT OSWEGO DASNY PROJECT JDE # 299390 FAA PROJECT # 11024.06

it is CHA's recommendation that the central heating equipment, aside from the summer/back-up boiler system, be replaced with new. Although the summer boiler and related components are approximately 15 years old, they appear to be in good condition due to limited use as back-up/summer equipment. CHA proposes the following systems:

- New pressure reducing station consisting of a 1/3 and a 2/3 pressure reducing valves
- New duplex condensate receiver
- New steam-to-hot water heat exchanger sized for the fitness addition and the new programmed space load.
- New heating hot water circulating pumps
  - o Two (2) 2 or 3-hp radiation pumps (with variable frequency drives)
  - o Two (2) 10 or 15-hp preheat/reheat coil pumps (with variable frequency drives)
- Replacement of existing shut-off valves and accessories on the steam, condensate and heating hot water piping systems.
- Replace existing steam, condensate and heating hot water piping based on the following conditions:
  - o Increased load due to fitness center addition and space programming.
  - Condition of existing piping. Test the existing steam, condensate, and hot water piping for existing wall thickness/condition.

Space cooling within the Littlepage building is provided by a 115 ton water-cooled chiller located in the steam room. The installation date for the chiller was unknown; however it appears to have been installed between 2000 and 2005 and is to be in good condition. A forced draft cooling tower, interconnected with the chiller, is located in the lower level fan room and draws/exhausts air from a roof mounted penthouse. Although installed indoors and protected from the weather, the cooling tower appears to be original to the building and shows sign of significant wear. Chilled water pumps (rated at 15-hp) and condenser water pumps (rated at 20-hp) are located in the steam room and also appear to be original to the building. Each pumping system (chilled water and condenser water) is provided with a back-up pump each sized for full system flow. Aside from the 115 ton chiller, the remaining chilled water equipment has exceeded its estimated service life. CHA recommends the existing equipment be replaced with the following new systems:

- New forced-draft cooling tower with variable frequency drives. Tower will be located in the fan room (ducted to the roof) or will be located directly on the roof. Actual location will be dependent on the school's preference and available space in the existing mechanical room.
- New condenser water pumps
  - o Two 20-hp pumps
- New chilled water pumps
  - o Two 15-hp pumps (with variable frequency drives)

STATE UNIVERSITY OF NEW YORK COLLEGE AT OSWEGO DASNY PROJECT JDE # 299390 FAA PROJECT # 11024.06

- Replacement of existing shut-off valves and accessories within the chilled water and condenser water systems
- Replace existing chilled water and condenser water piping based on the following conditions:
  - Condition of existing piping. Test the existing chilled water and condenser water piping for existing wall thickness/condition.
  - o Increased load due to fitness center addition and space programming.
  - The decision is made to condition/cool the kitchen make-up air and chilled water is the source for cooling medium.
- Existing chiller to remain unless the following conditions occur:
  - Increased load from the fitness center exceeds chiller capacity
  - The decision is made to condition/cool the kitchen make-up air and chilled water is the source for cooling medium.
  - o Water is the source for cooling medium.

Domestic water is supplied to the Littlepage building by a 3" domestic water service. The water service has a water meter installed, but does not have any means of backflow prevention. Domestic hot water is generated within a storage tank equipped with a steam tube bundle. The age and condition of the tank and tube bundle was unknown at the time of the site visit. The domestic hot/cold distribution piping and sanitary/vent system appeared to be original to the building, aside from various portions of the systems that have been modified over the years. After discussion with facility personnel, the existing sanitary and vent system appears to be in poor condition and in need of replacement. The domestic hot and cold water system appears to be in fair condition based on its age. CHA recommends the existing systems be replaced with the following new systems

- New domestic steam-to-hot water heat exchanger
- New sanitary drainage piping above ground
- New back flow preventers (two each sized at ½ flow)
- Provide camera inspection of sanitary piping below ground to determine condition. Replace
  existing piping in need of repair or as needed by newly programmed space layout.
- Replace portions of existing domestic hot and cold water piping showing signs of wear. Replace cold water pipe insulation with vapor barrier compromised.

The existing temperature control system consist of the original pneumatic control system along with pneumatic and electric control upgrades installed on various systems as they were upgraded over the years. A portion of the controls are hard networked back to the main mechanical plant at Lee Hall. Based on discussions with facility personnel, the campus goal is to provide a complete web based automation system for all campus buildings with a backbone based around Carrier or Trane controls.

Based on the age of the existing equipment and the campus goal of achieving a single web based control system for their campus, CHA recommends providing a complete replacement of the existing control system to include the following:

- Single Web base head end (based around Carrier or Trane controls). The system will include an operator work station (computer with monitor, keyboard, etc., a printer, appropriate graphics software) and all required equipment controllers. Controllers will include individual equipment controllers located throughout the building which will be networked such that the equipment can be observed and/or adjusted from the operator work station. Room temperature will be monitored with temperature sensors, which will be interlocked with the appropriate equipment controller to maintain the space temperature. The temperature control system will be used to control all heating, ventilation and air conditioning equipment serving the building, including the steam to hot water heat exchanger and associated pumps, chillers, air handling units, exhaust fans, VAV boxes with reheat coils, circulating pumps, and miscellaneous terminal units.
- Control strategies shall be included:
  - o Occupied/unoccupied scheduling
  - Chilled water reset
  - Hot water reset
  - o Discharge air temperature reset
  - Static pressure reset
  - o Demand control ventilation (CO2 control)
  - o Airflow monitoring
  - o Fan speed control
  - o Pump speed control

#### **Fitness Center**

The Fitness Center is provided heating, ventilation, and air conditioning (HVAC) thru a single 15,000 CFM air handling unit located in the lower level fan room. The unit consists of a supply fan, filter section, a hot water pre-heat coil, a chilled water cooling coil, and a hot water re-heat coil. Ventilation air is supplied through ductwork connecting the air handler to a louvered penthouse on the roof. The unit does not appear to have the ability to provide 100% outside air/100% exhaust air capabilities eliminating the possibility to provide economizer (free) cooling. A network of distribution ductwork supplies conditioned air to the fitness center through ceiling mounted diffusers.

Additional supplemental heat is provided thru perimeter fin tube run immediately in front of the exterior store front glass panels. The air handling unit and its related accessories appear to be original to the building's construction and have exceeded their useful life. The insulation wrapping the ductwork and hot/chilled water piping systems show signs of water damage likely caused by excessive condensate due to voids in the vapor barrier. This had resulted in damage to the insulation

and deterioration to the ductwork and piping systems wrapped by the compromised insulation.

Although the fin tube appears to be original to the building, it looks to be in good condition aside from sections of the enclosure that shows sign of localized damage. CHA recommends removing the existing air handling unit, duct work, and associated systems and replacing them with the following systems:

- New variable air volume (VAV) air handling unit sized for the existing space and the fitness
  addition. The air handling unit will be provided with a supply fan, return fan, mixing
  box/economizer section, hot water pre-heat coil, and a chilled water coil. CHA will also
  investigate the possibility of utilizing some form of exhaust air energy recovery provided
  sufficient space is available within the existing fan room.
- New shut-off VAV boxes with integral reheat coils.
- New distribution supply and return ductwork and associated accessories (grilles, registers, diffusers, dampers, etc)
- New building automation system for control of the air handling unit, VAV boxes and fin tube (see control section below).
- Replacement of perimeter fin tube enclosures showing signs of wear/damage. Provide electric control valves on the fin tube to provide zone level control thru the building automation system.

#### **Dining Space**

The dining space located on the upper level is provided HVAC thru a single air handling unit located in the lower level fan room and an energy recovery unit located on the roof. The air handling unit located within the fan room serves the general occupied space within the dining area through the supply of approximately 30,000 cfm. The units consist of a supply fan, filter section, a hot water preheat coil, a chilled water cooling coil, and a hot water re-heat coil. Ventilation air is supplied through ductwork connecting the air handler to a louvered penthouse on the roof. The unit does not appear to have the ability to provide 100% outside air/100% exhaust air capabilities eliminating the possibility to provide economizer (free) cooling. The energy recovery unit is a heating only unit that serves the kitchen hoods located in the center of the dining hall kitchen area. The packaged unit provides approximately 11,200 CFM exhaust and 8,900 CFM supply air to the kitchen space below and appears to be operational. The unit is composed of a supply fan, exhaust fan, outside air filters, face and bypass dampers, and an energy recovery device (the exact components of the energy recovery device were unknown at the time of the site visit). An additional steam face-and-bypass coil is located in the downstream ductwork for additional heat in the supply air stream. The air handling unit located in the fan room, and their related accessories, appear to be original to the building's construction and have exceeded their expected service life. The roof top energy recovery unit was installed in the mid 1980's and has also exceeded its expected service life. CHA recommends removing the units and replacing them with the following systems:

• New variable air volume (VAV) air handling unit sized for the dining hall heating and cooling load. The unit will be provided with a supply fan, return fan, mixing

STATE UNIVERSITY OF NEW YORK COLLEGE AT OSWEGO DASNY PROJECT JDE # 299390 FAA PROJECT # 11024.06

box/economizer section, hot water pre-heat coil, and a chilled water coil. CHA will also investigate the possibility of utilizing some form of exhaust air energy recovery provided sufficient space is available within the existing fan room.

- New shut-off VAV boxes with integral reheat coils.
- New distribution supply and return ductwork and associated accessories (grilles, registers, diffusers, dampers, etc) including linear slot diffusers run along the exterior perimeter of the dining space.
- New building automation system for control of the air handling unit, VAV boxes and fin tube (see control section below).
- Replacement of perimeter fin tube enclosures showing signs of wear/damage.
- New energy recovery kitchen make-up/exhaust air unit on roof.

#### **Pathfinder Dining Hall**

#### General

The basis of design, as presented below, is a general description of the concepts and systems proposed for the new facility. All equipment will be designed per the following codes:

- Building Code of New York State
- Mechanical Code of New York State
- Plumbing Code of New York State
- Energy Conservation Construction Code of New York State
- Fuel Gas Code of New York State
- Fire Code of New York State

#### **Central Mechanical/Plumbing System**

The Pathfinder building is supplied with district stream generated within the campus power plant. The medium pressure steam (mps) is supplied to the building at approximately 50 psig through a 5" mps line that enters the steam room in the northwest corner. The 5" mps line connects to a high/low pressure reducing station where it reduces to 12-15 psig low pressure steam (lps). Once reduced in pressure, the steam supplies a 6" lps header equipped with multiple supply taps serving the heating hot water heat exchanger located within the steam service room, the domestic water heater located in the adjacent mechanical space, and the kitchen equipment located on the floor above. A duplex condensate receiver, housed within the steam service room, serves as the central collection point for all steam condensate utilized within the building. Once collected, the duplex receiver pumps the condensate back to the campus power plant. The heating hot water generated by the steam-to-hot water heat exchanger is circulated through two sets of circulator pumps – one set of pumps (rated at 2-hp) serving the perimeter radiation system and one set of pumps (rated at 10-hp) serving the preheat and reheat coils located within the supply air ductwork.

FAA PROJECT # 11024.06

An additional "summer" steam boiler, condensate receiver, and surge tank is housed in a separate boiler room within the building. The "summer" boiler serves as a back-up heat source for the building during periods when the main campus power plant is shut down for annual maintenance or as needed during emergency steam back-up conditions.

The main steam pressure reducing station, condensate receiver, steam-to-hot water heat exchanger, hot water circulating pumps, distribution piping (steam, condensate and hot water), and valves appear to be original to the building (constructed in the mid 1960's). Based on the American Society of Heating Refrigeration and Air Conditioning Engineers (ASHRAE) recommendations (reference ASHRAE 2011 HVAC Applications Chapter 37), the existing equipment has exceeded its estimated service life. Based on the expectation that the building systems shall be capable of efficient operations for the next 20+ years, it is CHA's recommendation that the central heating equipment, aside from the summer/back-up boiler system, be replaced with new. Although the summer boiler and related components are approximately 15 years old, they appear to be in good condition due to limited use as back-up/summer equipment. The proposed new systems would consist of the following:

- New pressure reducing station consisting of a 1/3 and a 2/3 pressure reducing valves
- New duplex condensate receiver
- New steam-to-hot water heat exchanger sized for the new programmed space layout and associated load.
- New heating hot water circulating pumps
  - o Two (2) 2-hp radiation pumps
  - o Two (2) 10 hp preheat/reheat coil pumps
- Replacement of existing shut-off valves and accessories on the steam, condensate and heating hot water piping systems.
- Replace existing steam, condensate and heating hot water piping based on the following conditions:
  - Condition of existing piping. Test the existing steam, condensate and hot water piping for existing wall thickness/condition.

Space cooling within the Pathfinder building is provided by a 125 ton water-cooled chiller located in the steam room. The chiller was installed in 2003 and appears to be in good condition. A forced draft cooling tower, interconnected with the chiller, is located in the lower level fan room and draws/exhaust air from a roof mounted penthouse. Although installed indoors and protected from the weather, the cooling tower appears to be original to the building and shows sign of significant wear. Chilled water pumps (rated at 15-hp) and condenser water pumps (rated at 20-hp) are located in the steam room and also appear to be original to the building. Each pumping system (chilled water and condenser water) is provided with a back-up pump each sized for full system flow. Aside from the 125 ton chiller installed in 2005, the remaining chilled water equipment has exceeded its estimated service life. CHA recommends the existing equipment be replaced with the following new systems:

STATE UNIVERSITY OF NEW YORK COLLEGE AT OSWEGO DASNY PROJECT JDE # 299390

- FAA PROJECT # 11024.06
  - New forced-draft cooling tower with variable frequency drives. Tower will be located in the
    fan room (ducted to the roof) or will be located directly on the roof. Actual location will be
    dependent on the schools preference and available space in the existing mechanical room.
  - New condenser water pumps
    - o Two 20-hp pumps
  - New chilled water pumps
    - o Two 15-hp pumps (with variable frequency drives)
  - Replacement of existing shut-off valves and accessories within the chilled water and condenser water systems
  - Replace existing chilled water and condenser water piping based on the following conditions:
    - Condition of existing piping. Test the existing chilled water and condenser water piping for existing wall thickness/condition.
    - The decision is made to condition/cool the kitchen make-up air and chilled water is the source for cooling medium.
  - Existing chiller to remain unless the following conditions occur:
    - The decision is made to condition/cool the kitchen make-up air and chilled water is the source for cooling medium.

Domestic water is supplied to the Pathfinder building by a 3" domestic water service. The water service has a water meter installed, but does not have any means of backflow prevention. Domestic hot water is generated within a storage tank equipped with a steam tube bundle. The age and condition of the tank and tube bundle was unknown at the time of the site visit. In addition to the large storage tank/tube bundle, two small electric water heaters serve the men's and women's locker room in the campus police space. These heaters appear to be fairly new and in good condition. The domestic hot/cold distribution piping and sanitary/vent system appeared to be original to the building, aside from various portions of the systems that have been modified over the years. After discussion with facility personal, the existing sanitary and vent system appears to be in poor condition and in need of replacement. The domestic hot and cold water system appears to be in fair condition based on its age. CHA recommends the existing systems be replaced with the following new systems:

- New domestic steam-to-hot water heat exchanger
- New sanitary drainage piping above ground
- New back flow preventers (two each sized at ½ flow).
- Provide camera inspection of sanitary piping below ground to determine condition. Replace existing piping in need of repair or as needed by newly programmed space layout.

• Replace portions of existing domestic hot and cold water piping showing signs of wear. Replace cold water pipe insulation with vapor barrier compromised.

The existing temperature control system consists of the original pneumatic control system along with pneumatic and electric control upgrades installed on various systems as they were upgraded over the years. A portion of the controls are hard networked back to the main mechanical plant at Lee Hall. Based on discussions with facility personnel, the campus goal is to provide a complete web based automation system for all campus buildings with a backbone based around Carrier or Trane controls. Based on the age of the existing equipment and the campus goal of achieving a single web based control system for their campus, CHA recommends providing a complete replacement of the existing control system to include the following:

- Single Web base head end (based around Carrier or Trane controls). The system will include an operator work station (computer with monitor, keyboard, etc., a printer, appropriate graphics software) and all required equipment controllers. Controllers will include individual equipment controllers located throughout the building which will be networked such that the equipment can be observed and/or adjusted from the operator work station. Room temperature will be monitored with temperature sensors, which will be interlocked with the appropriate equipment controller to maintain the space temperature. The temperature control system will be used to control all heating, ventilation, and air conditioning equipment serving the building, including the steam to hot water heat exchanger and associated pumps, chillers, air handling units, exhaust fans, VAV boxes with reheat coils, circulating pumps, and miscellaneous terminal units.
- Control strategies shall be included:
  - o Occupied/unoccupied scheduling
  - Chilled water reset
  - o Hot water reset
  - o Discharge air temperature reset
  - o Static pressure reset
  - o Demand control ventilation (CO2 control)
  - o Airflow monitoring
  - Fan speed control
  - o Pump speed control

#### **University Police**

The University Police is provided space conditioning thru a single 15,000 CFM air handling unit located in the lower level fan. The unit consists of a supply fan, filter section, a hot water pre-heat coil, a chilled water cooling coil, and a hot water re-heat coil. Ventilation air is supplied through ductwork connecting the air handler to a louvered penthouse on the roof. The unit does not appear to have the ability to provide 100% outside air/100% exhaust air capabilities eliminating the possibility

to provide economizer free) cooling. A network of distribution ductwork supplies conditioned air to the offices and support spaces. Additional supplemental heat is provided thru perimeter fin tube run immediately in front of the exterior store front glass panels. Based on record drawings, the university police space received a minor renovation in 2000 immediately prior to the police occupancy of the space. During this renovation, local non-electrical valves were added to the fin tube to provide local control in each office space. Additionally, the air distribution system received some minor duct modifications and was rebalanced during the renovation. Although the renovations occurred in the recent past, various spaces within the university police space continue to experience various HVAC issues, including excessive noise in the conference room, difficulty maintaining space temperature (both heating in the winter and cooling in the summer), and excessive space relative humidity in the summer. Evidence of excessive space humidity can be seen in the existing drooping ceiling tiles indicative of moisture absorbance. The air handling unit and its related accessories appear to be original to the building's construction and have exceeded their useful life. The insulation wrapping the ductwork and hot/chilled water piping systems show signs of water damage likely caused by excessive condensate due to voids in the vapor barrier. This has resulted in damage to the insulation and deterioration to the ductwork and piping systems wrapped by the compromised insulation.

Although the fin tube appears to be original to the building, it looks to be in good condition aside from sections of the enclosure that shows sign of localized damage. CHA recommends removing the existing air handling unit, duct work, and associated systems and replacing them with the following systems:

- New variable air volume (VAV) air handling unit sized for the current program needs of the campus police space. The air handling unit will be provided with a supply fan, return fan, mixing box/economizer section, hot water pre-heat coil, and a chilled water coil. CHA will also investigate the possibility of utilizing some form of exhaust air energy recovery provided sufficient space is available within the existing fan room.
- New shut-off VAV boxes with integral reheat coils.
- New distribution supply and return ductwork and associated accessories (grilles, registers, diffusers, dampers, etc)
- New building automation system for control of the air handling unit, VAV boxes and fin tube (see control section below).
- Replacement of perimeter fin tube enclosures showing signs of wear/damage. Replace nonelectric valves with electric control valves interlocked with the building automation system.

#### **Dining Space**

The dining space located on the upper level is provided HVAC thru a single air handling unit located in the lower level fan room and an energy recovery unit located on the roof. The air handling unit located within the fan room serves the general occupied space within the dining area through the supply of approximately 30,000 cfm. The units consist of a supply fan, filter section, a hot water preheat coil, a chilled water cooling coil, and a hot water re-heat coil. Ventilation air is supplied

through ductwork connecting the air handler to a louvered penthouse on the roof. The unit does not appear to have the ability to provide 100% outside air/100% exhaust air capabilities eliminating the possibility to provide economizer (free) cooling. The energy recovery unit is a heating only unit that serves the kitchen hoods located in the center of the dining hall kitchen area. The packaged unit provides approximately 11,200 CFM exhaust and 8,900 CFM supply air to the kitchen space below and appears to be operational. The unit is composed of a supply fan, exhaust fan, outside air filters, face and bypass dampers, and an energy recovery device (the exact components of the energy recovery device were unknown at the time of the site visit). An additional steam face-and-bypass coil is located in the downstream ductwork for additional heat in the supply air stream. The air handling unit located in the fan room and their related accessories appear to be original to the building's construction and have exceeded their expected service life. The roof top energy recovery unit was installed in the mid 1980's and has also exceeded its expected service life. CHA recommends removing the units and replacing them with the following systems:

- New variable air volume (VAV) air handling unit sized for the dining hall heating and cooling load. The unit will be provided with a supply fan, return fan, mixing box/economizer section, hot water pre-heat coil, and a chilled water coil. CHA will also investigate the possibility of utilizing some form of exhaust air energy recovery provided sufficient space is available within the existing fan room.
- New shut-off VAV boxes with integral reheat coils.
- New distribution supply and return ductwork and associated accessories (grilles, registers, diffusers, dampers, etc) including linear slot diffusers run along the exterior perimeter of the dining space.
- New building automation system for control of the air handling unit, VAV boxes and fin tube (see control section below).
- Replacement of perimeter fin tube enclosures showing signs of wear/damage.
- New energy recovery kitchen make-up/exhaust air unit on roof.

#### 6. Electrical:

#### **Littlepage Dining Hall**

#### Power distribution and electrical service:

Power to the facility is currently fed from the campus wide 13.2kV medium voltage distribution system. The incoming medium voltage feeders come into the electrical room and terminate in a selector switch which can switch between the feeders from both Oneida Hall and Cayuga Hall. From a selector switch power is fed to a piece of switch gear with a step-down transformer, a main circuit breaker, and distribution section. The medium voltage step-down transformer is a 300kva with 120/208V three phase 4 wire secondary. The low voltage side of the switchgear is rated at 1600A. Circuit breakers in the distribution section of the switchboard feed various distribution panels throughout the facility as well as some mechanical equipment. The small distribution panels located throughout the facility are used to power small mechanical equipment, lighting, and receptacles.

STATE UNIVERSITY OF NEW YORK COLLEGE AT OSWEGO DASNY PROJECT JDE # 299390 FAA PROJECT # 11024.06

In terms of recommendations, the medium voltage selector switch and the switchgear have been recently replaced and are in excellent condition. The two panels in the fan room have also been recently replaced, and therefore no modifications are required for these panels. However, CHA recommends the following:

- Fitness area, the power panel in the maintenance supply room should be replaced. New circuits should be provided for any new mechanical equipment that is installed.
- Dining Services, the five recessed wall mounted panels in this area should be replaced in kind.

#### **Emergency power:**

No emergency power is installed at this site. CHA recommends the following:

- Fitness area, emergency wall packs will be installed for emergency egress lighting.
- Dining Services, emergency wall packs will be installed for emergency egress lighting.

#### Lighting:

The majority of the lighting throughout the facility is fluorescent. Corridors and office spaces have lay-in grid mount fixtures. In areas with exposed ceilings, industrial style 4' strip fixtures are installed. Some of the mechanical spaces are lit with incandescent lamps. Lighting levels in most spaces were adequate; however, most of the fixtures appeared to be towards the end of their useful life. CHA recommends the following:

- The incandescent lights in the mechanical supply room should be replaced with energy efficient fluorescent strip lights.
- Fitness area, each office area should receive (2) 2'x4' lay-in type fluorescent fixtures. Wall mounted occupancy sensors shall be used to control the lights in these areas. The fitness area should have new 2'x4' lay-in type fluorescent fixtures installed. These fixtures should be controlled by a wall mounted key switch.
- Dining Services, the light fixtures in the kitchen area are still in usable condition and can remain. The lights in the dining area should be replaced. A new lighting layout would need to be determined during detailed design, but 2'x4' or 2'x2' lay-in type fluorescent fixtures along with recessed fluorescent can fixtures would most likely be utilized.

#### **Fire Alarm System:**

The fire alarm system within the building is a Simplex system that has been recently upgraded. The main fire alarm control panel is located in the electrical room. Detectors, pull stations, and notification appliances are located throughout the facility and appear to provide the proper required coverage. The fire alarm system devices and head-end equipment are in good condition and can remain in place. However, CHA recommends the following:

 Fitness area, in areas that are reconfigured, fire alarm devices will be removed and saved for reinstallation. Wiring and conduit would need to be extended to the new locations.
 Additional devices shall be provided as required to provide the proper coverage in the REHABILITATION OF & ADDITION TO GLIMMERGLASS FITNESS CENTER & EXTERIOR BUILDING SHELL IMPROVEMENTS AT LITTLEPAGE AND PATHFINDER DINING HALLS
STATE UNIVERSITY OF NEW YORK COLLEGE AT OSWEGO

STATE UNIVERSITY OF NEW YORK COLLEGE AT OSWEGO DASNY PROJECT JDE # 299390 FAA PROJECT # 11024.06

renovated areas, although this will be of minimal amount. In rooms that remain unchanged, the devices can remain in place.

Dining Services, in areas that are reconfigured, fire alarm devices will be removed and saved
for reinstallation. Wiring and conduit would need to be extended to the new locations.
Additional devices shall be provided as required to provide the proper coverage in the
renovated areas, although this will be of minimal amount. In areas that remain unchanged,
the devices can remain in place.

#### **Telecommunications:**

There is an existing communications service entrance located in the main electrical service room. Communication wiring is routed throughout the building to various offices which require telephone and data connections. The existing communication service entering the building can remain in place. However, CHA recommends the following:

- Fitness area, in offices that are reconfigured, new data/telephone outlets would be installed
  with new Cat 6 wiring running back to the service entrance in the transformer room. In
  rooms that remain unchanged, the devices can remain as they currently are.
- Dining Services, no new data outlets are required in this area.

#### **Security system:**

CHA recommends the following:

- Fitness area, the existing access control system should be expanded to cover all the exterior
  doors into the fitness center. Additional camera coverage should also be provided to monitor
  the building entrances as well as select public spaces.
- Dining Services, the existing access control system should be expanded to cover all the
  exterior doors into the dining area. Additional camera coverage should also be provided to
  monitor the building entrances and select public spaces.

#### **Pathfinder Dining Hall**

#### Power distribution and electrical service:

Power to the facility is currently fed from the campus wide 13.2kV medium voltage distribution system. The incoming medium voltage feeders come into the electrical room and terminate in a selector switch which can switch between the feeders from both Seneca Hall and Cayuga Hall. From a selector switch power is fed to a piece of switch gear with a step-down transformer, a main circuit breaker, and distribution section. The medium voltage step-down transformer is a 300kva with 120/208V three phase 4 wire secondary. The low voltage side of the switchgear is rated at 1600A. Circuit breakers in the distribution section of the switchboard feed various distribution panels throughout the facility as well as some mechanical equipment. The small distribution panels located throughout the facility are used to power smaller mechanical equipment, lighting, and receptacles. Facility personnel mentioned that motor controllers in the mechanical room are currently powered from a single feeder. In order to work on one controller, power to all controllers must be turned off.

In terms of recommendations, the medium voltage selector switch and the switchgear have been recently replaced and are in excellent condition; therefore, no modifications are required. However, CHA recommends the following:

- University Police, the two power panels in the maintenance supply room and the one power panel in the transformer room should be replaced. Also the eight motor controllers in the mechanical room should be replaced and re-fed from a local panelboard with each motor starter on a dedicated circuit. New circuits should be provided for any new mechanical equipment that is installed.
- Dining Services, the five recessed wall mounted panels in this area should be replaced in kind.

#### **Emergency power:**

An emergency generator has been installed in the room adjacent to the electrical room. The generator was not operational at the time of our site visit. It was stated by the facility personnel that it is in the process of being installed to back-up the University Police. The generator is rated 40kw and has an output voltage of 120/240V single phase. CHA recommends the following:

- University Police, the existing generator will be reused to power all life safety loads in this area of the building (emergency lights, fire alarm etc.) An additional transfer switch and power panel will need to be installed to power these loads.
- Dining Services, the existing generator will be reused to power the emergency egress lights in this area of the building. The same transfer switch and power panel mentioned above can be used to power these loads.

#### Lighting:

The majority of the lighting throughout the facility is fluorescent. Corridors and office spaces have lay-in grid mount fixtures. In areas with exposed ceilings, industrial style 4' strip fixtures are installed. Some of the mechanical spaces are lit with incandescent lamps. Lighting levels in most spaces were adequate; however most of the fixtures appeared to be towards the end of their useful life. CHA recommends the following:

- The incandescent lights in the mechanical supply room should be replaced with energy efficient fluorescent strip lights.
- University Police, each office area should receive (2) 2'x4' lay-in type fluorescent fixtures. Wall mounted occupancy sensors shall be used to control the lights in these areas. In the corridors 2'x4' lay-in type fluorescent fixtures shall be installed 10' on center. The fixtures in the corridor shall be controlled by ceiling mounted occupancy sensors.
- Dining Services, the light fixtures in the kitchen area are still in usable condition and can remain. The lights in the dining area should be replaced. A new lighting layout would need to be determined during detailed design but 2'x4' or 2'x2' lay-in type fluorescent fixtures along with recessed fluorescent can fixtures would most likely be utilized.

#### Fire Alarm System:

The fire alarm system within the building is a Simplex system that has been recently upgraded. The main fire alarm control panel is located in the electrical room. Detectors, pull stations, and notification appliances are located throughout the facility and appear to provide the proper required coverage. The fire alarm system devices and head-end equipment are in good conditions and can remain in place. However, CHA recommends the following:

- University Police, in rooms that are reconfigured, fire alarm devices will be removed and saved for reinstallation. Wiring and conduit would need to be extended to the new locations. Additional devices shall be provided as required to provide the proper coverage in the renovated areas, although this will be of minimal amount. In rooms that remain unchanged, the devices can remain in place.
- Dining Services, in areas that are reconfigured, fire alarm devices will be removed and saved
  for reinstallation. Wiring and conduit would need to be extended to the new locations.
  Additional devices shall be provided as required to provide the proper coverage in the
  renovated areas, although this will be of minimal amount. In areas that remain unchanged,
  the devices can remain in place.

#### **Telecommunications:**

There is an existing communications service entrance located in the main electrical service room. Communication wiring is routed throughout the building to various offices which require telephone and data connections. The existing communication service entering the building can remain in place. However, CHA recommends the following:

- University Police, in rooms/offices that are reconfigured, new data/telephone outlets would be installed with new Cat 6 wiring running back the service entrance in the transformer room. In rooms that remain unchanged, the devices can remain as they currently are.
- Dining Services, no new data outlets are required in this area.

#### **Security system:**

CHA recommends the following:

- University Police, the existing access control system should be expanded to cover all the
  exterior doors into the police department area. Additional camera coverage should also be
  provided to monitor the exterior of the building, building entrances, and corridors as well as
  select public spaces.
- Dining Services, the existing access control system should be expanded to cover all the exterior doors into the dining area. Additional camera coverage should also be provided to monitor the building entrances and select public spaces.

# E-Shade™ Sunshades

Kawneer's Outrigger and Single Blade Systems for Storefront are the latest addition to its versatile Versoleil™ SunShade platform. Market demand for energy conservation in commercial building design is increasing, and the use of sunshades continues to move down the building. The addition of storefront options to Kawneer's innovative Versoleil™ SunShade offering provides more solutions for maximizing shading and energy-saving potential. The Outrigger System's combinations of support arms, louver blades and fascia caps provide increased aesthetic choices, and the Single Blade System's common component design and blade options offer versatility in both form and function. Whether it's the Outrigger System or the Single Blade System, Versoleil™ SunShades provide a pre-engineered, easy-to-install option for multiple storefront system applications.

#### **Enhanced Versatility**

Versoleil™ SunShade Outrigger and Single Blade Systems for Storefront include options in several configurations that enhance aesthetics while increasing the comfort and efficiency of the building. Both the Outrigger System and Single Blade System options deliver an unmatched breadth and depth of application — all from a single-source supplier. Not only are Versoleil™ SunShades tough performers, engineered and tested to withstand combined wind, snow and dead loads, they can also help contribute to Leadership in Energy and Environmental Design (LEED™) certification. Versoleil™ SunShades continue to set the industry standard for form and function.

TLEED is a registered trademark of the U.S. Green Building Council (USGBC).

REHABILITATION OF & ADDITION TO GLIMMERGLASS FITNESS CENTER & EXTERIOR BUILDING SHELL IMPROVEMENTS AT LITTLEPAGE AND PATHFINDER DINING HALLS STATE UNIVERSITY OF NEW YORK COLLEGE AT OSWEGO DASNY PROJECT JDE # 299390 FAA PROJECT # 11024.06

## 5. MEETING MINUTES

- A. Design Kick-Off Meeting 4-9-2012
- B. Design Meeting #1 5-21-2012
- C. Design Meeting #2 Glimmerglass Fitness Center 6-11-2012
- D. Design Meeting #3 Littlepage/Pathfinder Dining Hall 6-11-2012
- E. Design Meeting #4 University Police Dispatch Center 6-11-2012

SUNY Oswego Glimmerglass Fitness and Dining Hall Rehabilitation DASNY #299390

## Design Kick-Off Meeting

Meeting Date: April 9, 2012

Location:

SUNY Oswego Facilities, Conference Room

Attendees:

Tom SimmondsSUNY OswegoTom LaMereSUNY OswegoJanine TurnerSUNY OswegoFred ClarkDASNY

Andy Pappalardo

Gregory Carballada

Foit-Albert Assoc.

CHA

#### 1. Introduction:

1.1 Meeting was opened with introductions.

#### 2. Project Scope:

#### 2.1 Glimmerglass Fitness Center:

A. The renovation and expansion of the existing Glimmerglass Fitness Center located on the lower level of Littlepage Dining Hall. The scope of the renovations and addition shall follow the SUNY Oswego Fitness / Student Activities Master Plan dated December 2011.

#### 2.2 Littlepage Dining Hall:

- A. Mechanical System Upgrades: Scope to be determined.
- B. Building Shell improvements: Scope of the improvements shall follow the West Campus Dining Hall Building Shell Improvements Feasibility Study dated May 10, 2011.

#### 2.3 Pathfinder Dining Hall:

- A. Mechanical System Upgrades: Scope to be determined.
- B. Building Shell improvements: Scope of the improvements shall follow the West Campus Dining Hall Building Shell Improvements Feasibility Study dated May 10, 2011.
- C. University Police Program Upgrades: Scope to be determined.

#### 3. Open Discussion:

3.1 It was noted that the building shell work at the dining halls will follow the recently completed shell renovations on the adjacent resident halls.

- 3.2 Roof replacement will be part of the building shell work.
- 3.3 The feasibility study proposed some new window configurations. Design team to review and comment.
- 3.4 The Glimmerglass addition will follow mandated energy requirements; However the College does not anticipate pursuing LEED certification.
- 3.5 The master plan made some assumptions about the placement of toilet rooms and locker rooms that need to be reviewed. There may be conflicts with existing equipment. The stairs up to the dining common level are not used. The design team will speak with dining staff to determine what the plans are for the future of the stair. The design team should look at circulation and include outside access to fitness area.
- 3.6 The design team will meet with the University Police to determine a scope of work. Some of the issues that have been discussed are as follows:
  - A. High noise levels with the existing mechanical systems.
  - B. Ceiling tile issues that appear to be related to the mechanical systems.
  - C. Lack of privacy at specific window locations.
  - D. Possible renovations at the dispatch area.
- 3.7 The \$750,000.00 amount included in the project budget for mechanical system upgrades at both Littlepage and Pathfinder was based on an in-house assessment performed by Tom LaMere and John Moore. Tom will provide a copy of the assessment. The design team will perform a mechanical system survey, and analysis to verify the scope of work. Hazardous materials will need to be surveyed in that area. It is anticipated that the survey will be conducted with in approximately 4 weeks.
- 4. Next Scheduled Meeting:

Date:

TBD

Time:

TBD

Location:

**TBD** 

The above is my summation of our meeting. If you have any additions and/or corrections, please contact FAA (me) for incorporation into these minutes. After 48 hours we will accept these minutes as an accurate summary of our discussion and enter them into the permanent record of the project.

Sincerely,

Gregory R. Carballada, R.A. LEED AP Senior Project Manager, Associate

Littlepage and Pathfinder Dining Hall Shell Renovations & Glimmerglass Fitness Center addition at Littlepage DASNY #299390

Design Meeting #1

Meeting Date: May 21, 2012 at 10:00 AM

Location:

SUNY Oswego Facilities, Conference Room

Attendees:

Tom SimmondsSUNY OswegoTom LaMereSUNY OswegoJanine TurnerSUNY OswegoGregory CarballadaFoit-Albert Assoc.Jennifer KensyFoit-Albert Assoc.

Andy Pappalardo CHA
Karl Leabo CHA
Shaun DeMaranville CHA
Joe DeLaBruere CHA

#### 1. Introduction:

a. Meeting was opened with introductions. (Sign-in sheet attached)

#### 2. Schedule:

- a. Tom S. requested design team identify specific projects including budget, phasing, etc. during the pre-Schematic/Schematic phase.
- b. Design team to revise schedule to include specific milestone dates for report submissions.

#### 3. Project Scope:

a. Scope of work discussed and identified. (See attached)

#### 4. Open Discussion:

- a. Comments for both Littlepage and Pathfinder Dining Halls:
  - 1. Building facades don't need to make an aggressive statement, but they do lack a sense of entry.
  - 2. The loading dock areas are "gnarly" and often used as smoking areas.
  - 3. Need to look at the egress paths.
  - 4. Need to determine the need for security screens on windows. If required, will need to take into account how the installed screens will affect the buildings' aesthetics.

- 5. Design team shall model proposed window designs for Owner review. Existing window treatments will not be reused. Window design should not necessarily match but "blend" with recently renovated adjacent Residence Halls. It was noted that slider windows have not worked well on campus and double-hung windows were used in the adjacent Residence Halls.
- 6. Need to address the appearance of any proposed rooftop equipment. Consider painting elements in lieu of louver screens and avoid railings where possible.
- 7. An existing conditions assessment to address MEP budget items will follow this meeting. Campus staff John Bricker (HVAC) and Mike Sterling (Plumbing) are a resource for MEP team.

#### b. Comments for Littlepage Dining Hall:

- 1. May consider eliminating the existing interior stair connecting the dining hall and fitness center. This existing interior stair has already been enclosed and used only as an emergency exit route. It does not meet current code. A similar interior stair in Pathfinder has already been eliminated.
- 2. May consider a vegetation roof on the new Glimmerglass Fitness Center addition for visual purposes.
- 3. Design team shall provide a proposed cross-section of the new wall connection highlighting the interconnection between the 1-story addition, the dining façade above, and all coordinated mechanicals. Also need to confirm the interior and exterior heights of the proposed addition.
- c. Exterior shell improvements at the four (4) connecting tunnels adjacent to Littlepage and Pathfinder Dining Halls are to be included in the project scope. Doors at the connecting tunnels were noted to be in poor condition.
- d. It was noted that work on a Communications Project by RTKL is currently in progress to update campus data systems which may impact any work at the University police Dispatch Center.
- e. Meetings will be scheduled to meet with representatives for the dining hall (Craig), fitness center (Brian), and police dept. (Cindy) to discuss the following:
  - 1. Dining How their systems work, space functioning and finishes.
  - 2. Fitness Space functioning and equipment needs.
  - 3. Police HVAC issues, moisture issues, space functioning and control concerns.

#### 5. Next Scheduled Meeting:

Date:

TBD

Time:

TBD

Location:

**TBD** 

The above is my summation of our meeting. If you have any additions and/or corrections, please contact FAA (me) for incorporation into these minutes. After 48 hours we will accept these minutes as an accurate summary of our discussion and enter them into the permanent record of the project.

#### Project Scope of Work

SUNY Oswego - Littlepage and Pathfinder Dining Halls including Connecting Tunnels 5-30-12

#### LITTLEPAGE DINING HALL

#### **Building Shell Improvements:**

- Existing concrete façade will be patched and repaired where required, then treated with a wall coating (in Parkland finish)
- New aluminum windows and frames including new window treatments
- New HM doors and frames
- Roof replacement
- New exterior lighting
- Repairs to loading dock areas stairs, railings, bumper pads, etc.

#### Mechanical System Upgrades:

- New roof top unit
- Duct and air distribution
- New kitchen hoods
- Replace kitchen ceiling
- New chiller
- New HVAC units (2) with VAV boxes
- Controls
- Electrical

#### Glimmerglass Fitness Center Addition & Renovations:

- New single-story fitness center addition to building's east façade
- New single-story entry vestibule addition to building's south façade
- Fitness reception area
- Fitness area
- Multipurpose room
- Men's and Women's Locker Suites including new plumbing fixtures and new lockers
- Two (2) fitness offices
- Two (2) fitness storage areas
- · New doors, windows, finishes
- New interior lighting

#### PATHFINDER DINING HALL

#### **Building Shell Improvements:**

- Existing concrete façade will be patched and repaired where required, then treated with a wall coating (in Parkland finish)
- New aluminum windows and frames including new window treatments
- New HM doors and frames
- Roof replacement

- New exterior lighting
- Repairs to loading dock areas stairs, railings, bumper pads, etc.

#### Mechanical System Upgrades:

- New roof top unit
- Duct and air distribution
- New kitchen hoods
- Replace kitchen ceiling
- New chiller
- New HVAC units (2) with VAV boxes
- Controls
- Electrical

#### Renovation of Existing Spaces:

- University Police Dispatch Center scope of work to be determined, but may include:
  - o HVAC noise issues
  - o HVAC condensation issues ceiling tiles are sagging
  - o Possible fit and finish upgrades
  - o Coordinate any window issues

### **CONNECTING TUNNELS**

#### **Building Shell Improvements:**

- Existing concrete façade will be patched and repaired where required, then treated with a wall coating (in Parkland finish)
- New aluminum windows and frames
- New HM doors and frames
- New exterior lighting.

#### Renovation of Interior Spaces:

• Possible new finishes to be determined

**PROJECT TITLE:** 299390--OSWGC-Fitness Center Rehab:

**MEETING DATE:** 6/11/2012

9:30 am

SUBJECT: Design Meeting-Glimmerglass Fitness Center LOCATION: SUNY Oswego

3002005	Look at south and north sides for entry location; preference	STATUS START NEW	ED DUE BALL IN COURT
3002006	may be to north due to volume of users to the north.  2 offices total, 3 workstations (2/1), one office to function as private evaluation room for personal trainer.	NEW	
3002007	General storage room in diagram could be smaller (office sized?).	NEW	
3002008	Currently multipurpose room is roughly the correct size if storage component is relocated to a dedicated storage room.	NEW	
3002009	Multipurpose storage is to be used by students; it shouldn't be that closed off but still have close door option, shall house platforms, plyometric equipment, stability balls and the like.	NEW	
3002010	Multipurpose room shall have mirrors on one long and one short wall, natural lighting is important, but views are secondary.	NEW	
3002011	Need open floor space in fitness area for floor exercise, abdominal workouts and stretching.	NEW	
3002012	Design team to look at lockers to the west side, lockers at the entry side and remodeled lockers/showers in current toilet location [the latter being the most cost effective].	NEW	
3002013	Offices and general storage could go on west side, as offices don't need visual contact to fitness area.	NEW	
3002014	Design team was provided current equipment layout plan at Glimmerglass by SUNY Oswego for reference (attached).	NEW	
D	LITTLEPAGE BUILDING CONSIDERATIONS	NEW	
4002001	High voltage lines in northwest corner of exterior wall and tunnel; high cost relocation.	NEW	
4002002	Existing interior stairs connecting dining area and fitness center can be removed.	NEW	
4002003	Design team to look at code implications of sanitary facility requirement at dining room level.	NEW	
4002004	Dedicated primary circulation pattern should be articulated at core.	NEW	
4002005	Would extend hydronic to the addition; will require new radiators along the new glazed walls.	NEW	
4002006	Will address airflow issues; currently the area is too stuffy.	NEW	
4002007	No operable windows; natural ventilation is not desired.	NEW	
4002008	Need to determine where sanitary line leaves building.	NEW	
4002009	Need to determine scope of finishes at adjacent corridor: paint walls, overlay over existing floor or provide new, need to test mastic of existing floor tile and base for asbestos containing materials.	NEW	
E	KEY ITEMS TO ADDRESS	NEW	
5002001	Location for main entry vestibule.	NEW

ITEM	DESCRIPTION	STATUS STARTED DUE BALL IN COURT
A	INTRODUCTION	OPN
1002001	The meeting was opened with Introductions. (Sign-In Sheet Attached).	OPN
1003002	Purpose of this meeting to discuss current dining hall operations and establish preferences for the dining halls at Littlepage and Pathfinder as they may pertain to the expected exterior building shell improvements.	NEW
В	DINING HALLS BACKGROUND	NEW
2003001	HVAC is the biggest issue to resolve and priority #1; no house control of HVAC systems.	NEW
2003002	Existing air recovery unit does not appear to work.	NEW
2003003	Existing sun shades work well and are cleaned often.	NEW
2003004	Hot kitchens, solar gain in Spring and Fall, cold in Winter are significant issues.	NEW
2003005	Hours of Operation: Littlepage open 7:00am – 11:30pm (late night facility); Pathfinder open 7:00am - 7:00pm.	NEW
2003006	Existing kitchen equipment is in good condition.	NEW
2003007	2 single line servers are not ideal (out-dated) but in good condition, secondary bars for drinks, salads, desserts have been added; multiple stations are preferred (similar to Lakeside).	NEW
2003008	Existing dining room finishes are acceptable.	NEW
2003009	At-grade doors are rarely used; connecting tunnels are primary traffic.	NEW
2003010	Existing railing infill (plywood) at stair guards should be looked at for aesthetics and code compliance.	NEW
2003011	At Pathfinder: east stair is entrance, west stair is exit.	NEW
2003012	Loading dock is functional, but some sort of screening would be an enhancement and employee parking is of critical importance.	NEW

ITEM	DESCRIPTION	STATUS	STARTED	DUE	BALL IN COURT
2003013	Dumpsters are an eyesore; pick-up is Monday - Friday.	NEW			
2003014	No building drainage issues observed.	NEW			
С	DINING HALLS PREFERENCES AND CONSIDERATIONS	NEW			
3003001	Improve HVAC and establish comfortable working (kitchen) and dining environment; look at cooling in kitchen (chiller size, capacity).	NEW			
3003002	Client does not want operable windows.	NEW			
3003003	Look at light-colored modified bitumen sheet for roof to reduce some solar gain at rooftop equipment.	NEW			
3003004	Integrate serving stations (similar to Lakeside) into existing straight line cafeteria system.	NEW			
3003005	Focus on windows and window treatments for dining area, not so much on the current room finishes.	NEW			
3003006	Will consider different types of glazing, available clear vs. "Frit".	NEW			
3003007	Need to integrate pedestrian/car/truck traffic patterns at entrance areas.	NEW			
D	CLOSING	OPN			
4002001	Next Scheduled Meeting:	OPN

A	INTRODUCTION	OPN		
1002001	The meeting was opened with Introductions. (Sign-In Sheet Attached).	OPN		
1004002	Purpose of this meeting to discuss current university police dispatch center operations and establish preferences for possible renovations as thy may pertain to the expected exterior building shell improvements.	NEW		
В	UNIVERSITY POLICE DISPATCH CENTER BACKGROUND	NEW		
2004001	Center location is good.	NEW		
2004002	Current building exterior does not adequately (easily) identify Police are there.	NEW		
2004003	Access road is not well lit.	NEW		
2004004	Department space developed from non-traditional student housing suites.	NEW		
2004005	Current operations "horseshoe" layout is not ideal.	NEW		
2004006	Existing windows are a security issue.	NEW		
2004007	Multiple systems (fire alarm, burglar alarms, security, CCTV, etc.) are monitored in the communication/dispatch center.	NEW		
2004008	Need a new communications plan; previous multiple single systems have now been retired so there really is none.	NEW		
2004009	RTKL has been hired by client to work on a campus communications project.	NEW
